Seasonality

Daniel Williams

School of Public Affairs, Baruch College, City University of New York,
New York, New York, U.S.A.

INTRODUCTION

Seasonality is a term frequently associated with forecasting, but it is important to the analysis of any data in time. However, if the time element of the data is not recorded along with other characteristics, it is likely not possible to analyze or correct for seasonality. This entry addresses seasonality for both the forecaster and the non-forecaster. First, seasonality is defined. Next, the effects of seasonality are explained. Methods for removing seasonality from seasonal data are discussed, including complete procedures for implementing classical decomposition and a robust description of differencing, along with a brief introduction to more complex methods. Methods for including seasonality in statistical models are discussed, including Holt-Winters exponential smoothing, ARIMA with seasonality, and seasonal fixed effects regression.

WHAT IS SEASONALITY?

Seasonal patterns repeat over a fixed period of time, usually a year.^[1] In Fig. 1, data are plotted on the Y axis and time is plotted on the X axis, with the left representing the more distant past and the right representing the more recent past. We observe obvious peaks in the data in July and troughs in December. If there is uncertainty, it may be easier to observe seasonality if the X axis of the plot is limited to the length of the suspected period of the seasonal cycle, with sequential cycles are plotted separately as shown in Fig. 2. We call Fig. 2 a *seasonality plot*. Data that tend toward the same pattern of ups and downs over each segment are seasonal. If the overlapping series appear random or have conflicting peaks and troughs, the data are not seasonal.

While seasonality is commonly thought to be an annual phenomenon, it is also possible to have seasonality within other time segments. Fig. 3 uses a seasonality plot to demonstrate seasonality within weeks. These data reflect hours of operation at branches of the New York Public Library. Traffic may reflect a within week pattern, as well as a within day pattern. Fig. 4 uses a seasonality plot to demonstrate seasonality within quarters.

WHY CARE ABOUT SEASONALITY?

The reason we care about seasonality differs between forecasting and other statistical use of time-ordered data. For research in which seasonality cannot be examined due to failure to consider it in design, there is a third sort of concern.

Forecasting with data can be divided into explanatory and extrapolation methods. Seasonality is primarily a concern for extrapolation methods, including, for the purpose of this discussion, any method that uses a time index. Seasonality can impact the variance of the errors in extrapolation methods to the degree that the seasonal variance is a principal source of variance. The math of most extrapolation methods exploits the variance of the errors to produce reasonable forecasts. So unaccounted for seasonality prevents extrapolation methods from providing reasonable forecasts.

For other statistical uses, the problem can be that seasonality confounds the use of summary statistics in determining the fit of the statistical model. If both an independent variable and a dependent variable are seasonal in the same cycle, then standard methods of fitting statistical models will find the data to be correlated, regardless of whether there is any other association. Finding data correlated in this case is not necessarily meaningful. Typical diagnostics such as R^2 or t -tests are likely to be misleading.

For data that incorrectly fail to collect adequate seasonal information, the difficulty has to do with generalizing. Data collected at a particular time of the year may reflect special circumstances that are not representative of the entire year. For example, the type of patients seen at pediatric clinics at the beginning of the school year may be very different than those over the rest of the year, so patient satisfaction information collected at that time may not be generalizable to the whole year. If seasonal data are collected without awareness of the seasonal impact and without including seasonality in the design, research objectives may not be met.

WHAT TO DO ABOUT SEASONALITY?

Let us begin with the research design problem. Seasonality cannot be evaluated in research results, if data are not collected for that purpose. To collect such data, three

Fig. 1 Seasonal data.

conditions must be met. First, the study must extend over a long enough period of time for the seasonal effect to be observed. Second, the seasonal aspect of the data, that is the time at which the data are collected, must be recorded.

Third, the data collection should not be disproportionate with respect to seasonal activity. One cannot collect a handful of observations all year long, then a great mass of observations at a particular convenient time, and

Overlapping Years

Fig. 2 Seasonal plot.

Fig. 3 Seasonality within weeks.

expect to get a reasonable interpretation of any seasonal effect. Data should be either evenly collected over the year, as with a survey of the population at large, or proportional to the data that are available, as with the number of service recipients coming to an organization's office.

Of course, it is often inconvenient to collect data over an extended period of time. The consequence of this is that, although seasonality remains a factor, its impact cannot be observed. Other remedial or preventive steps can be taken in some instances. For example, with longitudinal studies, it may not be economically feasible to collect data quarterly, which would mitigate against unobserved seasonal impact. However, one can avoid attributing seasonal change to other causes by avoiding changing seasons from one year to the next.

Once data have been collected with seasonality in mind, the next step is to look for seasonality in the data. Except with longitudinal data, such analysis will be risky. Data will vary from period to period and may exhibit an apparent pattern when no seasonality exists. The best way to discover seasonality is to compare multiple years of data. When looking at a single year of data, the presence of a pattern may imply seasonal effect, but more evidence is needed. Some sources of additional evidence are a qualitative explanation of the seasonality or the presence of a similar pattern, with similar data collected at another time. Even if seasonality cannot be firmly established or rejected, many

parameters estimated over the entire seasonal cycle are unbiased with respect to seasonality.

Unfortunately, the solutions that apply to the simple research design problem do not extend into forecasting or time-ordered regression models. These problems require addressing seasonality itself. There are two basic ways to do this: one is to take seasonality out of the data; the other is to put seasonality into the statistical model. Reasonable people disagree on this topic. This author is a proponent of taking seasonality out of the data. A reason for this will be offered later in this article. However, because of the equally popular opposing view, three methods of putting seasonality into the statistical model are also discussed.

Taking Seasonality out of the Data

The seasonal adjustment techniques discussed here rest on the assumption that data are systematically collected over at least two seasonal cycles, preferably three or more. This article introduces only the simplest techniques. Some directions are given for exploring more sophisticated techniques.

Sometimes, seasonality depends on the level (current mean) of the series at the time of the season. Other times seasonality is unrelated to the level. Judge this by asking whether the seasonal difference is additive

Fig. 4 Within quarter seasonality.

(more like “100 units more in August”) or multiplicative (more like “25% more in August”). Fig. 5 shows multiplicative seasonality around linear growth of 10 units a month. With larger values of the level, the

seasonal peaks and troughs get farther away from the line. Fig. 6 shows additive seasonality around the same 10 units per month growth; in this figure, the size of the peaks and troughs is unrelated to level.

Fig. 5 Multiplicative seasonality.

Fig. 6 Additive seasonality.

Classical Decomposition

Deseasonalizing means adjusting a series to remove seasonal impact. The following shows the calculation of a simple annual seasonal index for monthly data for both multiplicative and additive techniques. This technique requires a minimum of two seasonal cycles but works better with three or more seasonal cycles.

First, calculate a *double moving average* as follows: calculate a 12-period single moving average using:

$$MA_{(L+1)/2} = (X_t + X_M + \cdots + X_{t-(L-1)})/L$$

Where $L = 12$ (for monthly data). The single moving average (MA) is shown in the third column of (Table 1).

Then calculate the double moving average (shown as TC in fourth column of Table 1).

$$TC_{t+6} = (MA_{(L+1)/2} + MA_{(L+1)/2+1})/2$$

This new moving average is a 12×2 *double moving average*. For seasonal periods other than monthly, calculate an $L \times 2$ moving average, where L is the number of periods for one seasonal cycle.

The *center* of a moving average is found by the expression $(L + 1)/2$. For example, the center of the moving average for data over January through December (points 1–12) occurs at the end of June and the beginning of July. Since June is point number 6 and July is number 7, the midway-between point is 6.5. The next

moving average covers February through the next January, points 2–13, and, by the same reasoning as before, the midway point is 7.5. The first double moving average value represents the center points 6.5 and 7.5, so its center is at 7, which is July in this example. This is why we label the TC associated with time t with a subscript for time $t + 6$.

To prepare to calculate a seasonal index, first enter the result of the TC on the same row as the actual observation for its centered period (July for years starting in January). There are 12 fewer moving average values than original (raw) values (the six observations at the beginning and the six at the end do not have enough observations for a 12×2 period moving average to be centered beside them). You will see in Table 1 that both MA and TC begin on the row labeled July. MA should actually begin at *June and one-half*, but there is no row for June and one-half. TC begins on the correct row.

These calculations produce an estimate of the trend cycle in the data, as shown by the solid line in Fig. 7. The (original) seasonal data are shown with the scatter plot. The centered trend-cycle estimate extends from the seventh period through the $(n - 6)$ th period (the period that is seven periods before the end).

To calculate a *multiplicative seasonal index*, proceed as follows:

Calculate an *approximate index* (I' , fifth column of Table 1) by dividing each actual value by the

corresponding TC_t value:

$$I'_7 = X_7/TC_7, I'_8 = X_8/TC_8, \dots, I'_{n-6} = X_{n-6}/TC_{n-6}$$

Average the index estimates for each month to get a smoother index (I'' , sixth column of Table 1).

This produces 12 values, one for each month:

$$I''_{JUL} = (I'_7 + I'_{19} + I'_{31} + \dots)/\text{count of Julys}$$

$$I''_{AUG} = (I'_8 + I'_{20} + I'_{32} + \dots)/\text{count of Augusts, etc.}$$

Normalize the index. Sum the 12 seasonal factors (shown above the average, also in the sixth column).

Copyright © 1999 From Handbook of Research Methods in Public Administration by Gerald J. Miller and Marcia L. Whicker, editors. Reproduced by permission of Taylor & Francis, a division of Informa plc.

Fig. 7 Trend cycle.

Use this sum as the denominator in a fraction whose numerator is 12 (or L when the seasonal data are not monthly). The resulting adjustment value, P , is multiplied by each value I''_t to produce an index I_t that sums (over all 12 months) to 12.

$$P = 12 / \sum_{i=1}^{12} I''$$

$$I_{\text{JUL}} = I''_{\text{JUL}} * P$$

$$I_{\text{AUG}} = I''_{\text{AUG}} * P, \text{ etc.}$$

This produces the $L = 12$ seasonal values. The results are shown in the boxed area in the seventh column of Table 1. The index is extended to the entire range of the data by repeating the index number for the month in every cycle.

To obtain deseasonalized data (DESEAS), divide the actual data by the index as shown in the next column of Table 1:

$$\text{DESEAS}_t = X_t / I_t$$

As shown by the circles in the deseasonalized data in Fig. 8, multiplicative classical decomposition substantially mitigates against the seasonal variation in the original data (marked with diamonds).

For *additive seasonality*, the steps mirror those for multiplicative seasonality, but substituting addition and subtraction for multiplication and division, as follows:

Calculate an approximate factor (F') by subtracting each TC_t from the actual observation, as shown

in the first column of the section labeled additive seasonality of Table 1:

$$F'_7 = X_7 - \text{TC}_7, F'_8 = X_8 - \text{TC}_8, \dots, F'_{n-6} = X_{n-6} - \text{TC}_{n-6}$$

If TC is greater than X , the approximate factor will be negative.

Average the factor estimates for each month to get a smoother factor (F''), as shown in the next column:

$$F''_{\text{JUL}} = (F'_7 + F'_{19} + F'_{31} + \dots) / \text{count of Julys}$$

$$F''_{\text{AUG}} = (F'_8 + F'_{20} + F'_{32} + \dots) / \text{count of Augusts, etc.}$$

Normalize the index. Sum the 12 seasonal factors. Divide this sum by 12. The resulting value is an adjusting value, P , that is subtracted from each value F''_t to produce an index that sums to 0. When periods are not months, adjust the denominator to the number of periods in the index. This is shown at the top of the second column of the additive seasonality section of Table 1.

$$P = \sum_{i=1}^{12} F'' / 12$$

$$F_{\text{JUL}} = F''_{\text{JUL}} - P$$

$$F_{\text{AUG}} = F''_{\text{AUG}} - P, \text{ etc.}$$

The results of this calculation are shown in the boxed area of the next column of Table 1. They are

Copyright © 1999 From Handbook of Research Methods in Public Administration by Gerald J. Miller and Marcia L. Whicker, editors. Reproduced by permission of Taylor & Francis, a division of Informa plc.

Fig. 8 Multiplicative deseasonalization.

then extended to the full range of the data by repeating the monthly values for every seasonal cycle.

Subtract the factor from the actual data to obtain deseasonalized data (DESEAS):

$$\text{DESEAS}_t = X_t - F_t$$

These results are shown in the last column of [Table 1](#) and in the circles in [Fig. 9](#). In comparing [Fig. 9](#) with [Fig. 8](#), we do not see a substantial difference in the deseasonalization effect. Armstrong argues that when there is modest or no trend, it makes little difference whether one chooses to use multiplicative or additive deseasonalization methods.^[2] The effect is found when the trend is strong. The reason for this effect is that the particular consequence of multiplicative seasonality techniques is that they make the size of the seasonal factors conditional on the size of the short-term mean value of the series. If that value does not change much, then there is little or no effect on the seasonal factors; therefore, the multiplicative seasonal factors mimic additive seasonal factors. It is, therefore, more important to choose the correct method when there is a strong trend, in which case one should return to [Figs. 5](#) and [6](#). If the amplitude of the seasonal plot does not change as the series increases, the seasonality is additive. If the amplitude increases, the seasonality is multiplicative.

This discussion has focused on seasonality of monthly data, with the year beginning in January,

but the actual data may begin in any month, be quarterly data, or have seasonality over some period other than a year. If appropriate adjustments are made, this method can be used with data cumulated over any interval and with any seasonal cycle.

Differencing

An alternative to seasonal adjustment is to calculate the first differences of the seasonal period. That is, the difference between observations that occur at the same point in two sequential seasons. For example, if monthly data follow annual seasonality, as with the previous discussion, calculate differences across years by subtracting the observation in January of year 1 from the observation in January of year 2. For year 3, subtract year 2 data from year 3 data, continuing until the data run out. Observations are now differenced (subtracted one from another) at the same point in the season, so between them there is no seasonal effect. All the new observations are without seasonality.

The new observations are increments of change, not the underlying level of the data. There are many times when this is the most meaningful observation to analyze. However, it is likely that increments of change can be associated only with other increments of change. Thus, if these are data used as a variable in a regression model, and there are other time-ordered variables, they should be differenced as well.

Fig. 9 Additive deseasonalization.

More Sophisticated Decomposition Methods

Classic decomposition has the limitation that its estimated seasonal factors are static, whereas actual seasonal factors may change over time. The reader may refer to the software and documentation available at the U.S. Census Bureau at <http://www.census.gov/srd/www/x12a/> to find more sophisticated methods. This website provides the basic equipment for using a procedure known as X-12, which is a much more sophisticated (and complex) version of the procedure discussed above, and is likely the most commonly used form of seasonal adjustment in the world. Use of X-12 is documented on the website and is also discussed in Ref.^[1] and by Ladiray and Quenneville.^[3] X-12 is a recently updated version of software long known as X-11, and much of the material still refers to the earlier version. The Ladiray and Quenneville text is for the advanced student.

Another advanced method is labeled TRAMO/SEATS. This is a mixed regression and ARIMA method that has been developed by Victor Gomez and Agustin Maravall of the Bank of Spain. Explanation is beyond the scope of this article. Both X-12 and TRAMO/SEATS have been implemented in open-source software such as GRETL (<http://gretl.sourceforge.net/>). X-12 is also available in the SAS statistical package and in a variety of forecasting packages.

Confounding Seasonality

Miller and Williams have shown that some typical seasonal methods confound other sources of variation with seasonal factors.^[4,5] While this demonstration is not made separately for each distinctive method for addressing seasonality, there is no special reason to think that any particular method is immune to the confounding effect. The chief focus of these articles is with the confounding of seasonality with random variation. However, other unexplained variation could also be subject to the same confounding effect. Miller and Williams demonstrate techniques for correcting this confounding effect. As with X-12, these techniques are sophisticated beyond the scope of this article. However, once the analyst has become sufficiently comfortable with the techniques demonstrated here, examination of these articles is strongly recommended. Software (spreadsheets) that implement these procedures can be found at <http://hops.wharton.upenn.edu/forecast/software.html#Freeware>.

Using Deseasonalized Data

Once seasonality has been taken out of the data, the data can be forecast, correlated, or otherwise analyzed, as it might otherwise be without concern for the seasonal impact. If it is forecast, it should be

reseasonalized—that is, the seasonal factors should be used in reverse—to complete the forecast.

PUTTING SEASONALITY INTO THE STATISTICAL MODEL

The other option to dealing with seasonality is to address it within the statistical model one builds. This method is not recommended. There are several reasons for this. First, for forecasting, Miller and Williams have demonstrated that typical methods of accounting for seasonality confound seasonal and random variation.^[4,5] Current methods for correction only exist for classical decomposition and X-12. While the confounding effect has not been demonstrated for each method of seasonal estimation, there are good reasons to believe that it exists. Therefore, it is best to use those methods that can be corrected. Second, one of the most common seasonal forecasting methods, Holt–Winters exponential smoothing, is subject to severe drift. This means that the seasonal factors tend to sum to values other than L within relatively few seasonal cycles. The correction for this is to renormalize the factors. But renormalizing reduces the effect of updating and is very complex. Compromises such as renormalizing once a quarter or once a year are arbitrary. While these may not be sufficiently satisfactory reasons for every forecaster, forecasting experience has led the current author to be reluctant to use seasonal forecasting models.

The reason for deseasonalizing when not forecasting, as with using time series data in regression models, is more apparent. Seasonal factors, which are explained in a later section, substantially affect regression diagnostics. When working with independent and dependent variables that are seasonal in the same period and with the same general seasonal model, one can anticipate strong correlation (and thus, good regression diagnostics), simply because of the seasonality. This effect, however, should be uninteresting to the analyst. The seasonal correlation may mask a complete lack of period-to-period covariation. This masking effect renders the use of seasonal data contrary to good practices.

Nevertheless, the informed reader should know about the principal methods within this class. The following is a brief review of three methods of including seasonality within statistical models. The first two specifically address forecasting models. This discussion is not intended to be exhaustive.

Holt–Winters Exponential Smoothing

A technique developed by Winters permits seasonality to be updated within the Holt exponential smoothing model, a well-known trend-forecasting method.^[6]

These methods have been modestly updated by Williams.^[7] When the seasonal model is additive, one can use the Winters' additive exponential smoothing model.^[8] These models use multiplicative indexes or additive factors to adjust for seasonality in a manner similar to classic decomposition. However, the index is included within an exponential smoothing (also known as exponentially weighted moving average) framework. With exponential smoothing, the current period forecast error is used to update the value of the forecast component; thus, in the Winters' model, the error is used to update the seasonal index for the same period in the next seasonal cycle. In the Holt model, the same error is also used to update two other elements of the forecast. This updating process allows the error to automatically correct the values of the various forecast components over time. There is considerable evidence that the Holt class of models are among the more effective time series forecast techniques.^[9] Thus, Holt–Winters models are a good candidate for integrating seasonality within forecast models. For more discussion of these models, see Chapter 4, on pages 135–184 of Ref.^[1]

ARIMA Modeling

ARIMA is a sophisticated forecasting method that is beyond the scope of this article. Nevertheless, it contains within it techniques for dealing with seasonality. The following symbols, which are specific to ARIMA modeling, show the sort of model that may address seasonality for monthly data, $ARIMA(p, d, q)(0, 1, 1)_{12}$. The “ p, d, q ” symbols within the first parenthesis are parameters that might take on alternate values for different types of data. The second parenthesis specifies a typical seasonal pattern, but as with the first parentheses, the parenthesis can contain (p, d, q) a great variety of parameter values. The subscript 12 refers to a 12-period (annual with monthly data) seasonality. For a more thorough explanation of ARIMA modeling, the reader may want to refer to Chapter 7, on pages 311–387 of Ref.^[1]

Regression with Indicators

In regression modeling, “dummy” or “indicator” variables can be created specifying 11 of the 12 months, three of the four quarters, etc. In basic multiple regression, you should have been taught not to create indicator variables the entire exhaustive set of options; one option must be left for inclusion in the base model. Thus, there are 11, not 12, indicators for months. An indicator is simply a variable that has a value of zero when a condition is not met and a value of one when it is met, so if it is the indicator for January, you would

code the entire column zero (0, not “ ” or “missing”) and then code just the Januaries one (1). Follow the same practice for Februaries through Novembers. If you expect it to be easier to interpret the data with Decembers coded, then omit some other month. The *t*-test for the indicator variable coefficient examines the degree to which the indicator month differs from *the month in the base model*. If none of the *t*-tests for the indicator variable coefficients are statistically significant, then it is arguably the case that there is no measurable seasonality. In the language of econometrics, this approach is seasonal “fixed effects.”

This process consumes 11 degrees of freedom from your regression, so you should be careful in using it. (It is arguably the case that other procedures discussed above sometimes consume degrees of freedom without revealing it.) It is sometimes suggested that this procedure should be tested with the “stepwise” procedure found in many regression packages. The current author discourages such testing.

CONCLUSION

Seasonality is a substantial concern for users of data in time. Procedures are provided that lead to correction of seasonal effect. Because of known modeling defects, it is recommended that statistical modelers use deseasonalized data; however, methods for inclusion of seasonality in statistical models are described. Procedures for classical decomposition are provided, and differencing is robustly described.

Senior Executive Service

Robert F. Durant

American University, Washington, District of Columbia, U.S.A.*

INTRODUCTION

Promoted and launched during the presidency of Jimmy Carter, the Senior Executive Service (SES) was comprised in 2006 of approximately 8000 career and non-career personnel who staff the top managerial and supervisory positions in the U.S. federal government. A central component of the Civil Service Reform Act (CSRA) of 1978, the SES was established “to provide more effective management of agencies and their functions, and the more expeditious administration of the public business.”^[1] Members of the SES were to serve just below top presidential appointees and afford critical links between appointees and the remainder of the career civil service. Today, they are involved with key government activities in approximately 75 federal agencies. Nearly three decades after its creation, however, the contemporary SES is the legatee of the conflicting purposes of its designers; congressional influence on the implementation of the SES; public attitudes toward government service; and the disparate emphases, strategies, and tactics of individual presidential administrations. Because of the interaction of these factors, the actual performance of the SES has not lived up to the promise envisioned by its creators.

ORIGINAL LOGIC

The culmination of nearly three decades of unsuccessful proposals to create an American higher civil service, the SES originally rested upon several core beliefs.^[2] First, public management skills and knowledge represent a coherent professional craft that is applicable across different types of organizations. Second, a cadre of top public managers could improve the efficiency and effectiveness of public agencies, as well as gain a better appreciation of the public interest, if they were able to escape the confines of traditional single-agency civil service careers. Third, reforms in the areas of pay and flexibility were needed to enhance the recruitment, retention, and development of senior government managers. Finally, the responsiveness of careerists to political executives could and should be maximized by giving the latter greater flexibility to assign, direct, and evaluate the work of the former.

The straightforwardness of these core beliefs belies the extent to which conflicting ideas existed among proponents about the ultimate aims of the SES.^[3] For some, the SES represented the embodiment of an elite European-style corps of generalist civilian executives carrying rank-in-person rather than rank-in-position, a concept rejected by earlier reformers. In contrast, others saw the SES as a vehicle for controlling an allegedly unresponsive federal bureaucracy. Still others viewed the SES as a way either to bring highly touted private sector management techniques into the federal government or to improve stealthily the pay and perquisites of career civil servants. The most talented among the latter had experienced pronounced pay compression early in their careers because maximum executive pay was limited to congressional pay levels.

In trying to accommodate these disparate purposes, the SES focused on four primary areas of personnel management: position allocation, staffing, performance incentives, and executive development.^[4] To combat the highly fragmented set of personnel authorities that existed prior to the CSRA, Congress created the SES as a unified executive personnel management system. It did so by converting formerly GS-16 through GS-18 and Executive Level IV and V positions into a cadre of SES positions filled by career and non-career managers. Persons in those positions were given the option of joining the SES. To facilitate central control of SES allocation while giving agencies flexibility and discretion in staffing SES positions, the CSRA provided that agencies submit requests for SES positions to the Office of Personnel Management (OPM). After reviewing these requests, the OPM was to allocate specific numbers of SES positions for a 2-year period. Agencies then could staff these positions by transferring career appointees to any SES vacancy after giving them 15 days notice of reassignment.

To enhance political responsiveness and provide for lateral or “outsider” appointments from the private sector, the CSRA also allowed a portion of all SES positions to be filled by non-careerist political appointees. The logic of this approach, questioned by many, is that the greater the number of political appointees in an agency, the more control a president has over

an agency's agenda.^[5] Yet to limit politicization and protect merit principles, the CSRA stipulated that no more than 10% of all SES positions could be allocated to non-careerists, and no more than 25% of all SES positions in any single agency (with some exceptions) could be staffed by political appointees.

To these ends, the CSRA designated two separate types of SES positions. The first type—career reserved positions—is for civil servants only because specialized technical or professional expertise is needed to perform the responsibilities of these jobs. The second type—general positions—is open to careerists and political appointees alike because specialized skills are not deemed necessary for performing job duties. Controls also existed against prohibited personnel practices related to merit principles, as did provisions ensuring that SES members cannot be involuntarily reassigned within 120 days of the appointment of a new agency head or non-career supervisor. Neither could they be involuntarily transferred between agencies, be RIFed (reduction in force) in the wake of agency cutbacks or downsizing absent competitive exams, nor be demoted lower than the GS-15 level.

To encourage the participation of careerists in the SES program, to improve the performance of SES members, and to link their performance to organizational goals, the CSRA attached grade and rank to persons rather than to positions. It also replaced largely trait- and tenure-based appraisal with pay-for-performance evaluations and bonus-award systems, while touting executive development programs to improve the skills of SES members. In collaboration with their supervisors, SES members were to set organizational and personal goals annually, and were to be rated by their supervisors in terms of how well they met these goals. Until fiscal year 2004, performance appraisal was premised on a pass-fail system that was scrapped in the fiscal year 2004 National Defense Authorization Act (Public Law 108-136) in favor of more rigorous and realistic ratings (see below).

The SES members also were eligible for rank awards and bonuses for superior job-related performance. Two types of rank awards were created, with SES members eligible to receive either type once every 5 years: a \$10,000 Meritorious Rank Award and a \$20,000 Distinguished Rank Award. In addition, members were eligible to receive a performance bonus of 5–20% of their base salary. To avoid politicization of the awards process and to ensure fairness, Performance Review Boards comprised of a majority of non-career SES members were to determine who qualified for bonuses each year.

By the same token, however, SES members also could be removed from the SES for “less than fully satisfactory” performance. Persons slated for removal could seek an informal appeals hearing with the Merit

Systems Protection Board (MSPB). If not recertified, SES members had the right to a formal MSPB appeals hearing. In no instance were SES members to give up any protections or appeals rights afforded to non-SES members of the federal service in cases of adverse actions. Nonetheless, removal from the SES for performance would not qualify as an adverse action.

THE POLITICAL APPOINTEE–CAREERIST NEXUS

How well have these conflicting SES core beliefs, values, and purposes fared in practice over the past quarter of a century as they relate to the political appointee–careerist nexus in the federal government? Studies of the SES that have relied primarily on staffing and perceptual data of SES members suggest that those who either feared or welcomed politicization of the higher civil service confront a decidedly more complex picture. During the early Reagan presidency (especially 1981–1983), fears or hopes of politicization were well founded. Under the CSRA, after all, political appointees were the ones “monitoring, evaluating, and rewarding or punishing” SES members.^[6] While the Carter administration used these tools, the Reagan administration had the first opportunity to engage in full-scale implementation of the SES provisions. Reagan appointees worked assiduously to use non-career SES positions (as well as even heavier use of Schedule C appointments at the GS 13–15 levels than had their predecessors) to advance the President's policy agenda.

Between 1980 and 1986, for example, the Reagan administration significantly increased the proportion of non-career SES members overall to maximum allowable limits (an increase from 8.4% to 9.8% of all SES positions). The administration also targeted specific agencies for installing disproportionate numbers and percentages of non-career SES members between 1980 and 1983. For example, the total number of non-career SES appointments at the Department of Defense ($N = 88$), the Department of Justice ($N = 50$), the Environmental Protection Agency (EPA; $N = 23$), and the Department of Housing and Urban Development ($N = 32$) reflected increases from the Carter years of 47%, 117%, 28%, and 33%, respectively.^[5,7] Likewise targeted for disproportionate increases in non-career SES appointees were central staff agencies such as the Office of Management and Budget (OMB), the OPM, and the General Services Administration (GSA). Anecdotal evidence also clearly suggests that the Reagan administration used unattractive transfers to coax careerists into accepting (or at least not opposing) Reagan's agenda.

Scholarly research also finds evidence that the Reagan administration “sorted out” career SES members in terms of their likelihood of supporting the President’s agenda. Those most likely to oppose Reagan’s policies were placed in less influential organization positions.^[8] As such, by 1986, the number of SES members indicating that they had “a great deal” of influence over policy dropped to 20% from nearly 50% 5 years earlier, and a significant exodus from the SES ranks occurred.^[6] This exodus was prompted also, however, by Congress subsequently reducing the percentage of SES members eligible for bonuses from up to 50% to 25% of total SES membership in an agency (later reduced to 20% by the OPM).

Yet, data from 1986 to 2000 indicated a decidedly different pattern that led researchers to dismiss politicization as an apt description of what had happened to the SES since the early Reagan years. One researcher summarizing a host of General Accounting Office (GAO) studies concluded in the late 1980s that “[e]vidence of the wholesale politicization of the [SES]...is slight.”^[9] Similarly, one of the nation’s leading experts on these trends concluded in the mid-1990s that efforts to politicize the senior civil service had reached their practical limits by the mid-1980s. Most likely this was because of the complexity of the appointment process generally and the high level of turnover in appointee positions.^[6] Thus, the percentage of non-career appointees fell from 9.3% in 1986 to 8.7% in 1992, whereas the total number of SES positions encumbered by the Clinton administration in 1998 declined by 16% from the last year of the first Bush administration.^[10]

These trends, however, do not mean that President George H.W. Bush and President Clinton failed to use SES appointments strategically to advance portions of their agendas. For example, the total number of SES appointees (i.e., positions filled) increased by nearly 22% (from 6702 to 8130) from 1986 to the end of the Bush administration in 1992. Likewise, although the total number of SES positions in 1998 fell to approximately 6804 positions under the Clinton administration’s “Reinventing Government” initiative, this drop merely returned the number of SES positions to historical levels. Patterns of disproportionate use of non-career SES members in different agencies also did not disappear. Reflecting, for example, the discretion that these heavily outsourced agencies have in awarding contracts, greater numbers and percentages of non-career SES members were placed in agencies such as the EPA, the Department of Energy, and the GSA. What did change, however, was that SES appointments during both the Bush and the Clinton administrations were decidedly less ideological in tone, more concerned about patronage (Bush) or diversity (Clinton)

than policy, and predicated more generally on promoting cooperative relationships with the career bureaucracy.^[11]

Under the George W. Bush administration, the total number of SES members was 7868 in 2004–2005. To advance the goals of the President’s Management Agenda to promote Strategic Management of Human Capital, however, the Bush administration launched a substantial reform of the SES that became part of the fiscal year 2004 Defense Authorization Act. Under the act and a subsequent executive order by Bush, agencies that were not certified by OMB as having rigorous performance standards that could make real distinctions among SES members were given different pay scales from those agencies that were certified. Non-certified agencies could have a minimum rate of basic pay equal to 120% of the rate for GS-15, step 1 (\$109,808 in 2006) and a maximum rate of basic pay equal to the rate for level III of the Executive Schedule (\$152,000 in 2006). Those with OMB-certified performance programs were given a higher maximum pay equal to level II of the Executive Schedule (\$165,200 in 2006). For agencies certified by OMB, the maximum rate of basic pay for senior level and science and technology SES members could match the Vice President’s salary (\$212,100 in 2006).^[12]

Also noteworthy is how much the SES has changed over the years in racial, gender, partisan, and ideological composition under both Democrat and Republican administrations. The representation of women in the SES increased from 10% to 22% between fiscal year 1988 and fiscal year 1999, whereas minority representation increased from 7% to 13%.^[13] By 2003, minority men and women comprised 14% of the SES, and white women comprised 19%. This left the SES still overwhelmingly dominated by white men (67%). The GAO also argues that enhanced efforts by agencies to improve diversity in the SES will be required because of projected retirements; analysts project that racial and ethnic minority representation will increase by only 0.7% if the same mix of appointees in federal agencies continues.^[14] Finally, although Democrats enjoyed a three-to-one margin among supergrade career civil servants in 1968, research indicates that the parties are in rough parity today in the SES.^[10] Leading students of this dynamic attribute current partisan parity to a combination of motivations and trends.^[10] These include turnover in the SES of Democrats disgruntled by the policies and attitudes toward careerists of the early Reagan administration (1981–1984);^[15] Republican presidents using SES appointments to promote and reward Republican careerists; the reflection in careerists of societal trends in party identification; and the partisan repositioning of some in the SES to advance their careers during Republican presidencies.

PROMISE VS. PERFORMANCE

Assessing the political appointee–careerist nexus in the SES tells little directly about how well it has attained the CSRA’s original management goals. Given the absence of pretest performance data, analyses of the differences between pre-SES and post-SES individual, program, or agency performance do not exist. Consequently, most scholarly research on the SES has examined performance only indirectly by assessing the extent to which SES provisions have been faithfully implemented. Most of these studies also rely on the perceptions of SES members rather than on objective implementation metrics. Nonetheless, both types of studies are revealing in noting continuities and discontinuities in perceptions over the decades.

A 1987 study using content analysis of SES performance standards between fiscal year 1980 and fiscal year 1984, for example, found no significant decrease in relying on personal trait evaluations, despite the CSRA’s emphasis on work performance evaluations.^[9] This finding arose amid other studies documenting the Reagan administration’s use of “clustering” career SES managers in smaller and less important programs, “shadow staffing” political appointees to bypass career SES managers, and leaving career SES slots vacant while filling all non-career positions available.

Other studies drew various negative management inferences from research done by the MSPB, the Federal Executive Institute Alumni Association (FEIAA), and the GAO.^[15] Not only had 40% of all participants who joined the SES in 1979 left the federal government by 1987, but also over two-thirds of respondents to FEIAA surveys in 1983 and 1985 argued that the Reagan administration had not created conditions favorable for good management.

As noted above, dissatisfaction also flourished among SES members because Congress failed to provide the originally promised levels of bonuses to them during these years. Reacting to these events, morale among SES members fell from a high of 83% satisfaction in 1980 to a low of 56% in 1983. It then rebounded to 74% over the remainder of the decade after a substantial pay hike by Congress, and returned gradually to initial 1980 levels by 1991.^[10] Moreover, by the late 1990s, a survey of SES members found that an astoundingly high 94% of SES members were either “very satisfied” (56%) or “mostly satisfied” with their jobs (38%).^[10]

Throughout the 1990s, researchers using a variety of more sophisticated statistical techniques also portrayed a somewhat less negative picture of the promise vs. the performance of the SES. In particular, support was found for several of the basic theories underlying the CSRA. For example, analyzing an SES subsample ($N = 4300$) of 21,620 federal respondents to a 1986

MSPB survey, researchers found a strong relationship between performance rewards, individual performance, and agency performance.^[4] They also found that as prohibited personnel practices decreased, both agency performance and public confidence in the agency increased.

Not all the news was good, however. Other researchers revisiting the exit rate question in the early 1990s still found that the second most powerful set of predictors of intent to leave the SES involved the political appointee–careerist nexus. One study, for example, found that the more concerned the SES members were about political control over their work, the more likely they were to be thinking about leaving the SES. In addition, this same study found that the single most powerful predictor of intent to leave the SES was how strongly respondents believed that they were unable to influence public policy. On a more positive note, however, research also suggested that widespread abuses of merit principles were no longer as great a perceived problem. Correlations in one study, for example, were insignificant between perceptions of arbitrary personnel practices and intent to leave the SES.^[16]

Nonetheless, things did not get better after the new pay-for-performance reforms instituted by Congress and the George W. Bush administration for fiscal year 2004 took effect.^[17] In 2006, the Senior Executives Association released the results of a survey of SES members that identified major problems in the program. Among other issues, respondents (with older and longer-serving SES members over-represented) indicated their belief that: 1) ratings quotas or forced distributions by the Bush administration were reducing high ratings; 2) a disconnect existed between rewards and performance; 3) the system was reducing morale and motivation; 4) eliminating SES ranks obfuscated important distinctions among job responsibilities; and 5) greater transparency of the ratings process was necessary.

CONCLUSION: FUTURE OPPORTUNITIES AND CHALLENGES

As one noted observer of the SES puts the dilemma, the concept of an SES “has not been a ringing success in any country (with the possible exception of Australia).”^[18] The SES, however, remains attractive because of its compatibility with “the flexibility in recruiting, assignment, and performance management necessary to achieve other reform objectives” that have swept the United States and abroad.^[18] Its emphasis on employee development is also compatible with what leading experts say is necessary to make the federal service a competitive employer in the

21st century. As the federal government tries to attract an increasingly “in and outer” cadre of federal workers who no longer see their careers in terms of a single organization, the SES emphasis on employee development, performance measurement, rank-in-person, and portability of benefits is well tailored for the multi-organizational and cross-sectoral workforce of the 21st century.

Prior research also suggests, however, that serious challenges will continue to confront the SES. First, to the extent to which the findings of the 2006 Senior Executives Association survey are generalizable and valid for all SES members (not just those with longer tenure), significant reform is needed in the George W. Bush administration’s implementation of pay-for-performance reforms. Second, diversity needs continuing improvement, salaries commensurate with responsibilities and comparable positions in the private sector are critical, and issues involving the appropriate balance between political and careerist influence over policy will remain salient. Third, advances in succession planning in the wake of an aging SES workforce are critical. Occupationally, the highest rates of eligibility for retirements will occur in health system administration and criminal investigation, but all agencies will be affected.^[19] For example, the EPA, the Nuclear Regulatory Commission, and the Veterans Administration will be especially hard hit. Not all those eligible to retire will do so, but unprecedented numbers will leave. These retirees, in turn, will take with them the experiential base, leadership background, and institutional memory and skills that historically have contributed to the allure of creating an SES in the first place.

Seniority

Alan L. Saltzstein

Division of Political Science and Criminal Justice, California State University, Fullerton, California, U.S.A.

INTRODUCTION

Seniority is best defined as the granting of preference in certain personnel actions based on an employee's length of service. Seniority refers to salary increases, promotion, and the receipt of other benefits, based on the amount of time in service. Seniority is considered a valid principle for personnel actions because years within a position may provide one with superior organizational insight, experience, and loyalty.^[1]

ORIGINS OF SENIORITY IN PUBLIC ADMINISTRATION

Many consider seniority an element of an efficient bureaucratic organization. Weber, for example, lists "promotion according to seniority or to achievement" as an important component of an efficient bureaucracy.^[2] He argued that entrance into an office "is considered an acceptance of a specific obligation of faithful management in return for a secure existence."^[3] Employment security then contributes to the objective administration of duties "where legal guarantees against arbitrary dismissal or transfer are developed, they merely serve to guarantee strictly objective discharge of specific office duties free from all personal considerations."^[3] Thus, secure employment, of which seniority is a major component, provides the officer with protection from political interference and encourages loyalty to the goals of the organization. Generally, then, seniority encourages organizational loyalty and commitment to the objective application of laws.

The concept, however, is frequently viewed negatively in the American context because of perceived conflicts with three other principles of personnel action: merit, political direction, and equal employment. Merit is generally defined as the attempt to make employee competence the major criteria affecting employee decisions. Advances obtained by seniority are believed to favor those with lower qualifications for the position over those hired or promoted through comprehensive testing or analyses of skills and accomplishments. Political direction refers to the link between the aims of political leaders and bureaucratic

response. Seniority appointments are generally less likely to follow the lead of political supporters than those who are politically appointed. Equal employment means treating all groups equally within the personnel process. This includes those groups and people who have been historically discriminated against. Seniority is viewed as a policy likely to favor those people and groups who have historically held positions. Often those who hold existing positions advanced, while those who faced discrimination were held back. Thus, in organizations where discriminatory practices favored the hiring and retention of White males, seniority is generally a policy that encourages those discriminatory patterns to continue.

Seniority and Merit

Conflicts between seniority and merit are common when employees are unionized and when collective bargaining and negotiation influence personnel decisions. Union members generally want seniority to influence policies related to promotion and layoff of employees. Merit principles would encourage promotions and layoffs based on performance or objective testing. Unions often support application of the merit principle in the hiring of employees but seek to limit its application in promotion and layoffs. They argue that the hiring process should be the major application of merit in public service. They maintain that promotions and layoffs ought to be governed by seniority, to protect the interests of the worker and promote employee stability and loyalty.

Seniority and Political Appointment

Concerns for seniority also conflict with the interests of political leaders. When the spoils system predominated, hiring, pay, and promotion were determined by the party in power. Thus, unless an employee was politically active and the party was victorious, job security was unlikely. The advent of civil service, of course, limited the extent to which those in power could control appointments. The aim was a bureaucracy guided by those with extensive knowledge and experience in the managing of government.

Interest in greater political direction of the administration frequently leads to calls for political appointees. Those who support the values promoted by seniority, stability, expertise, and non-partisan competence often oppose such efforts. The Senior Executive Service provisions of the 1978 Civil Service Reform Act, for example, increased the numbers of politically appointed positions and initially encouraged lateral entry to the Senior Executive Service. Members of the civil service in particular opposed the lateral entry provisions. From the perspective of higher-level civil servants, lateral entry represented a challenge to the positive values promoted by a career civil service. The Senior Executive Service positions were viewed as jobs rightly obtained by those with long service in the bureaucracy.

Seniority and Equal Employment

Basic conflicts often arise between seniority and equal employment of individuals and groups that have experienced discrimination in employment. If groups have suffered discrimination historically, they are less likely to populate the upper regions of the bureaucracy. Seniority often prevented woman and minority members from advancing in the bureaucracy. Further, if seniority influences layoff procedures, discriminated groups will lose many of the gains they have won more recently. “Last hired, first fired” is a commonly heard mantra that often, in fact, reflects the reality of layoff policy in modern government.

Conflicts between layoff policies and equal employment bring forth fundamental disputes within the American value system. The equal protection clause of the Fourteenth Amendment and the 1964 Civil Rights Act are interpreted as supporting the rights of all people to be treated equally in personnel policies. They give standing in court to those charging government with discriminatory personnel policies.

However, the value of seniority in personnel practices was formally written into the 1964 Civil Rights Act through section 703(h), which states:

It shall not be an unlawful employment practice for an employer to apply different standards of compensation or different terms and conditions or privileges of employment pursuant to a bona fide seniority or merit system. Provided such differences are not the result of intention to discriminate because of race, color, and religion, sex or national origin.

This provision was placed in the act in response to supporters of seniority. The reference to intentional discrimination and the use of the term “bona fide” were added as a compromise between those who believed that the seniority provision would curtail the

ability of excluded groups to challenge employment policy and those who advocated seniority.

The presence of section 703(h) within legislation designed to enhance the employment rights of excluded groups has led to a series of challenges often reaching the Supreme Court.^[4]

Conflicts between the two principles remain unresolved, as the court tries to deal with cases of employment discrimination. Decisions have tended to side with seniority, rather than with equal employment. *Wygant v. Jackson Board of Education* focused on a collective bargaining agreement that contained a provision mandating that, when layoffs occurred, seniority would be maintained, except that at no time would there be a greater percentage of minority personnel laid off than the current percentage of employment.^[5] This resulted in the laying off of non-minority teachers, while certain minority teachers were retained. The court sided with the non-minority teacher and restored the teacher’s position. The decision was based in part on the seniority provision in the 1964 Civil Rights Act. Justice Powell, in his majority opinion, stated the case for seniority most clearly:

Many of our cases involve union seniority plans with employees who are typically depended on wages for their day-to-day living. Even temporary layoff may have adverse financial as well as psychological effects. A worker may invest many productive years in one job and one city with the expectation of earning the stability and security of minority. At that point, the rights and expectations surrounding seniority make up what is probably the most valuable capital asset that the worker ‘owns,’ worth even more than the equity in his current home . . . Layoffs disrupt these expectations in a way that general hiring goals do not.^[5]

More recently, the Supreme Court ruled in favor of seniority, even when a change in the seniority system in effect limited the seniority of recently hired female employees. The case involved workers in an AT&T Technologies plant. A prior collective bargaining agreement determined that workers accrued seniority on the basis of plant-wide service, and plant-wide seniority was transferable upon promotion to a more skilled position. A more recent agreement changed seniority, making it dependent on the amount of time in a new position. Women who lost the position had been advanced to receive demotions they would not have sustained under the old agreement. The court, however, sustained the new seniority system, arguing that it was not discriminatory on face value. Justice Scalia argued that a discriminatory impact is not sufficient to invalidate the system: “actual intent to discriminate must be proved. By allowing facially neutral systems to be challenged and entitlements under it altered many years after its adoption, would disrupt

those valid reliance interests that 703(h) were meant to protect.’’^[6]

A vigorous dissent by Justice Stevens argued that the majority interpretation here is contrary to the intent of provision 706(e). The provision, he argued, was never meant to immunize seniority systems from the requirements of Title VII.

CONCLUSION

Seniority remains a guiding principle of American personnel policy. Its strict application conflicts with concerns for merit, political direction, and equal employment. It stands for stability and continuity against those who want to change employment policy to reflect political and social change. The frequency of court challenges focusing on seniority suggests that

its place within the public administration process will remain uncertain.

Sexual Harassment

Sally Coleman Selden

School of Business and Economics, Lynchburg College, Lynchburg, Virginia, U.S.A.

INTRODUCTION

Twenty years ago, in its landmark case, *Meritor Savings Bank, FSB v. Vinson*, the U.S. Supreme Court ruled that sexual harassment, including a sexually hostile work environment, constitutes unlawful sex discrimination.^[1] Responding to these incidents, the Supreme Court offered multiple decisions in the late 1990s and early 2000s that modified sexual harassment laws and might have slowed the number of sexual harassment claims filed with the Equal Employment Opportunity Commission (EEOC). The recent allegations of sexual harassment against Congressman Foley by a teenage page highlight a growing concern in public and private workplaces, especially in retail and food service establishments, about sexual harassment of teen employees. The EEOC launched its Youth at Work campaign to educate teens and younger workers about discrimination in the workplace. In 2005, the EEOC filed two employment discrimination lawsuits on behalf of teen workers against franchises of McDonald's restaurant in Arizona and New Mexico.^[2] Sexual harassment in the workplace and in educational institutions is not a new issue, but its heightened visibility has forced human resource (HR) managers to review organizational policies and dissemination strategies.

The purpose of this article is to introduce the concept of sexual harassment and discuss the current policy environment.^a First, it provides statistics about incidents of sexual harassment in the workplace. Second, the article provides an overview of the policy and legal frameworks necessary to manage harassment, including pertinent legislation, relevant Supreme Court decisions, and administrative regulations governing sexual harassment. Finally, broad guidelines for designing an organizational sexual harassment policy are outlined.

CURRENT ENVIRONMENT: INCIDENTS AND REPORTING OF SEXUAL HARASSMENT DECLINING, BUT A GAP REMAINS BETWEEN THE TWO

Although sexual harassment remains an area of concern for all organizations, including educational

institutions and their employees, a recent survey shows that complaints of sexual harassment have steadily declined over a 3 yr period.^[3] In 2005, 48% of corporate attorneys and HR managers surveyed indicated that their companies had no complaints of sexual harassment, up from 44% in 2004 and 37% in 2003.^[3] Sexual harassment filings with the EEOC and the Fair Employment Practices agencies (FEPA) have also decreased during this same period (see Table 1). Between 1992 and 2001, the number of sexual harassment charges filed with the EEOC under Title VII grew 46.9% from 10,532 to 15,475. Between 2001 and 2005, the EEOC shows an 18% decline in formal sexual harassment charges filed. However, staffing levels at the EEOC during this 4 yr period fell by 19%. Without further study, it is hard to discern whether the decline in formal complaints with companies, the EEOC, and Fair Employment Practices reflects an actual decline in incidents of sexual harassment, a lack of willingness to report such incidents, understaffing, or better training. For example, in 2002, 21% of women and 7% of men surveyed reported that they had been sexually harassed at work.^[5] By 2005, according to a Louis Harris poll, the percent of women experiencing harassment grew to 31%, while the percentage of men remained steady at 7%.^[6] Moreover, the poll showed that 62% of persons experiencing harassment had never reported it to their organizations.^[6] Given that the percentage of complaints filed by men has steadily increased since 1992 (see Table 1), men may feel more empowered to report incidents of sexual harassment in the workplace.

Studies have shown that both women and men experience harassment and that some harassment occurs repeatedly and for long periods of time.^[7,8] However, many individuals who are sexually harassed elect not to report the incident or to use an employer's sexual harassment policy.^[9] Because of this tendency, the number of formal complaints filed may underestimate the pervasiveness of sexual harassment in an organization. While the evidence suggests that sexual harassment is an enduring and pervasive workplace concern, it is difficult to ascertain the exact magnitude of the problem because individuals define and experience sexual harassment differently and often elect not to share their experience with the organization formally.^[6]

^aThis article is an abbreviated and updated version of the author's previously published work.

Table 1 Sexual harassment charges filed with EEOC and FEPA under title VII FY 1992–FY 2005

Fiscal year	Number of charges filed	Percentage filed by men (%)
1992	10,532	9.1
1993	11,908	9.1
1994	14,420	9.9
1995	15,549	9.9
1996	15,342	10.0
1997	15,889	11.6
1998	15,618	12.9
1999	15,222	12.1
2000	15,836	13.6
2001	15,475	13.7
2002	14,396	14.9
2003	13,566	14.7
2004	13,136	15.1
2005	12,679	14.3

Abbreviations: EEOC = Equal Employment Opportunity Commission; FEPA = Fair Employment Practices Agencies.

THE PUBLIC POLICY ARENA OF SEXUAL HARASSMENT

Relevant Legislation

Sexual harassment is a complicated area of employment law, partly because employers must comply with both state and federal laws, which have been interpreted differently by the courts. Before turning to a discussion of the judicial decisions that provide broader policy direction to the interpretation of federal law, this section briefly reviews laws that govern sexual harassment cases and workplace policies in both the public and the private sector. Practitioners should note that when state sexual harassment laws offer greater employee protection, they take precedence over federal guidance. Illinois, for example, was the first state to ban sexual harassment of state employees. Considerable variation exists among states with respect to the legal doctrine governing sexual harassment. Some states, such as New Hampshire, New Jersey, North Dakota, Pennsylvania, Rhode Island, West Virginia, and Wisconsin, have antisexual harassment laws. These antisexual harassment laws employ EEOC's definition of sexual harassment, but they vary in terms of policy requirements and punishments. For example, in Rhode Island, employers with 50 or more employees are required to adopt and distribute a workplace policy and statement against sexual harassment. In 2004, California passed legislation requiring employers of 50 or more to provide 2 hr of sexual harassment

prevention training to supervisors every 2 yr. Wisconsin's law requires the board of regents to include sexual assault and sexual harassment in its orientation program for newly entering college students.

At the federal level, three laws are of particular significance to employers: Title VII of the Civil Rights Act (CRA) of 1964; Title IX of the Education Amendments of 1972; and the CRA of 1991. Title VII of the CRA of 1964 prohibits employment discrimination based on race, sex, national origin, or religion. It applies to public, non-profit, and private organizations, with one exception (see Ref.^[10] for a discussion of how the law pertaining to a hostile environment varies among employers). Military personnel are not covered by Title VII, although Department of Defense civilian employees are.^[11] Over time, Title VII prohibition against sex discrimination has been interpreted to include sexual harassment. In 1976, a federal district court found that firing an employee for refusing the sexual advances of a supervisor was illegal under Title VII.^[12] The next year, three federal courts of appeals reversed lower court decisions that had held that sexual harassment was not within the scope of Title VII.^[13–15] In 1980, the EEOC issued regulations that defined sexual harassment as a form of sex discrimination prohibited by the CRA of 1964. These EEOC regulations were validated by the 1986 Supreme Court Case of *Meritor Savings Bank, FSB v. Vinson*.^[1]

Title IX of the Education Amendments of 1972 prohibits sex discrimination in schools and school programs that receive federal funding. The law applies to elementary, secondary, and postsecondary schools and is enforced by the Office for Civil Rights of the Department of Education. When sex discrimination has occurred, schools, colleges, and universities are given an opportunity to correct the problem. If an appropriate action is not taken by the educational institution, federal funding may be revoked.

Lastly, the CRA of 1991 includes provisions that expand a victim's right to sue and collect compensatory (punitive) damages for sexual discrimination or harassment. Prior to this legislation, plaintiffs could only collect backpay and attorneys' fees. In an organization with more than 200 employees, for example, a victim of sexual harassment may recover a combined award of compensatory and punitive damages up to \$300,000. Moreover, and arguably, the most significant provision of the 1991 CRA grants sexual harassment plaintiffs the right to jury trials.

Supreme Court Decisions

Defining sexual harassment under Title VII of the CRA of 1964: The courts have identified two basic types of sexual harassment that are actionable under

Title VII—quid pro quo and the hostile work environment. Much of the case law defining the parameters of sexual harassment emerged first from lower courts. For example, the 1981 judicial decision *Bundy v. Jackson* was critical in forming today's legal definition of sexual harassment.^[16] The Court ruled that Bundy was the victim of a practice of sexual harassment and a discriminatory work environment, and her rights under Title VII were therefore violated. The sexually stereotyped insults and demeaning propositions to which Bundy was subjected caused her undue anxiety and created an "offensive or hostile" work environment. Thus, a two-dimensional approach to sexual harassment claims emerged. Sexual harassment claims could be classified as quid pro quo or hostile work environment.

Five years after the *Bundy* case, the Supreme Court issued its first landmark decision regarding sexual harassment—*Meritor Savings Bank, FSB v. Vinson*.^[17] The Court affirmed the distinction that emerged from *Bundy v. Jackson*, holding that two types of harassment are actionable under Title VII: Harassment that involves the conditioning of employment benefits on sexual favors (quid pro quo) and those where a hostile environment is created.^[16] Mechelle Vinson testified that Sidney Taylor, her supervisor and a vice president of Meritor Savings Bank, repeatedly demanded sexual favors from her, usually at the bank both during and after work hours. Finding for Vinson, the Court ruled that non-economic injury was a form of sex discrimination covered by Title VII, but the Court did not address employer liability with the same clarity. The Court strongly agreed with the EEOC that Congress wanted the courts to apply agency principles—defining a supervisor as an agent of the employer and imputing responsibility to the employer when a supervisor exercises authority delegated to the supervisor by the employer—to guide decisions on employer liability. Nevertheless, the Court remanded the case to lower courts, to determine the conditions under which employers are held responsible. The Supreme Court disagreed with the Court of Appeals decision "that employers are always automatically liable for sexual harassment by their supervisors... For the same reason, absence of notice to an employer does not necessarily insulate that employer from liability." While the *Meritor* decision offered clarity to the legal definition of sexual harassment, it left considerable uncertainty around what forms of behaviors constitute harassment, especially those that create a hostile environment, and the extent of employer liability or responsibility for such an environment.^[10]

By the early 1990s, lower court rulings varied tremendously, concerning the severity and pervasiveness of behaviors required to create a hostile work environment.^[10] In 1993, the Supreme Court addressed

this issue in its decision, *Harris v. Forklift Systems, Inc.*^[17] The Court ruled that victims need not show that they suffered serious psychological injury as a result of the harassment, in order to prevail in court. The Court affirmed the standard stated in *Meritor Savings Bank v. Vinson*—"Title VII is violated when the workplace is permeated with discriminatory behavior that is sufficiently severe or pervasive to create a discriminatorily hostile or abusive working environment" as determined or perceived by a "reasonable" person. While the Court did not elaborate on the definition of a "reasonable" person, the EEOC has stated that "the reasonable person standard should consider the victim's perspective and not stereotyped notions of acceptable behavior."^[18] The issue is whether a "reasonable" person in the "victim's circumstances would have found the alleged behavior to be hostile or abusive."^[18]

In this case, Charles Hardy, the president of the company, had referred to Harris, the plaintiff, as a "dumb-ass woman," made unwanted sexual innuendos to her, and asked her (and other female employees) to get coins from his front pants pocket. Harris complained to Hardy about his conduct, who promptly apologized and promised to cease. Within a month, Hardy resumed his behavior, leading Harris to quit and, subsequently, file suit against Forklift Systems. The company argued that because Teresa Harris had not demonstrated any obvious psychological harm as a result of Hardy's actions, Title VII was not violated. Finding for the plaintiff, the Court unanimously ruled that Title VII "comes into play before the harassing conduct leads to a nervous breakdown. A discriminatorily abusive work environment, even one that does not seriously affect employees' psychological well-being, can and often will detract from employees' job performance, discourage employees from remaining on the job, or keep them from advancing their careers."

In 2001, the Supreme Court stressed the legal differences between single offensive comments and a hostile environment. In its decision, *Clark County School District v. Shirley A. Breeden*, the Supreme Court ruled that no one reasonably could believe that a single comment with sexual overtones violates Title VII of the CRA of 1964.^[19] Sexual harassment is only actionable if it is "so severe or persuasive" as to "alter the conditions of the victim's employment and create an abusive working environment." Shirley Breeden met with her male supervisor and another male employee to review four job applicants' psychological evaluations. One evaluation contained an applicant's sexually charged comment. Breeden's male supervisor read the comment, "I hear making love to you is like making love to the Grand Canyon" aloud and remarked, "I don't know what this means." To which, the male

colleague stated “I’ll tell you later.” After the incident, Breeden complained about the exchange to the offending supervisor and to two other supervisors in the organization. Breeden charged that she had been harassed and retaliated against because she had been transferred after her complaint. The Court ruled, because the remark did not constitute unlawful sexual harassment under Title VII, that Breeden did not have a valid claim of retaliation.

Prior to 1998, the Supreme Court had not heard a harassment case involving persons of the same sex. The Court ruled in *Oncale v. Sundowner Offshore Services, Inc.* that “nothing in Title VII necessarily bars a claim of discrimination . . . merely because the plaintiff and the defendants . . . are of the same sex.”^[20] In this case, Joseph Oncale worked on an eight-man crew aboard an oil platform in the Gulf of Mexico. Oncale contended that his male supervisors and coworkers abused and sexually taunted him, pushing a bar of soap into his anus and threatening homosexual rape. Although he complained to his employer, the company did not respond, so Oncale quit. The Court judged that Title VII’s prohibition against discrimination “because of sex protects men as well as women.” This decision provides numerous employees, previously overlooked, protection against sex discrimination under Title VII. The Court, however, noted that Title VII “does not prohibit all verbal or physical harassment in the workplace” but makes actionable only conduct “so objectively offensive as to alter the ‘conditions’ of the victim’s employment.” Thus, “ordinary socializing in the workplace—such as male-on-male horseplay or intersexual flirtation” is not illegal. The Court noted that “common sense, and an appropriate sensitivity to social context, will enable courts and juries to distinguish between simple teasing or roughhousing among members of the same sex and conduct that a reasonable person in the plaintiff’s position would find severely hostile or abusive.” The Court, however, gave little guidance for determining when conduct crosses the line to sex-based discrimination, leaving lower courts to work out what proof is required to establish that same-gender harassment is because of sex.^[21] As a result, the Court’s broad, conduct-based analysis might be interpreted by lower courts in ways that allow standards to vary depending on the work environment.

Defining employer liability for sexual harassment under Title VII of the CRA of 1964: Courts have addressed the conditions under which an employer is held liable or responsible for sexual harassment. In 1998, the Supreme Court ruled on two such cases, one involving a public employer and one involving a private employer. Both cases establish identical rules of laws.^[22]

In *Faragher v. Boca Raton*, the Court determined that public employers can be held liable for harassment

under Title VII, even if the employee has not explicitly alerted the employer about the sexual harassment.^[23] However, the employer may raise an affirmative defense to liability or damages depending on the situation. During Beth Ann Faragher’s 5 yr employment as a lifeguard for the City of Boca Raton, Florida, her immediate supervisors repeatedly subjected Faragher and other women lifeguards to “uninvited and offensive touching,” lewd remarks, and denigration of women. The City of Boca Raton asserted that because the harassment was not reported to higher authorities and occurred in a remote location, it should not be held liable. While the city had a sexual harassment policy, it had not widely disseminated the policy. The Court held that this failure defeated any invocation of an affirmative defense to liability. Clarifying conditions of an employer’s vicarious liability, the Court adopted the following stance:

An employer is subject to vicarious liability to an . . . employee for an actionable hostile environment created by a supervisor . . . When no tangible employment action is taken, a defending employer may raise an affirmative defense to liability or damages . . . The defense comprises two necessary elements: 1) that the employer exercised reasonable care to prevent and correct promptly any sexually harassing behavior and 2) that the plaintiff employee unreasonably failed to take advantage of any preventive or corrective opportunities provided by the employer or to avoid harm otherwise.

The Court confirmed that no affirmative defense is available when an employee is terminated, demoted, or undesirably reassigned.

In a separate but related decision about employer liability, *Ellerth v. Burlington Industries*, Kimberly Ellerth’s second-level supervisor, Ted Slowik, repeatedly threatened her job unless she succumbed to his advances.^[24] She never registered a formal complaint nor was her job ever jeopardized, but after 15 mo as a salesperson for Burlington Industries, she resigned because of the constant harassment. Burlington Industries argued that it should not be held liable because Ellerth had suffered no job consequence and had even been promoted; moreover, she had failed to use the company’s sexual harassment complaint procedure.

The Court stated that Congress gave an explicit instruction to the courts to interpret Title VII based on agency principles, by defining the term “employer” to include its “agents.” Building on this rationale and consistent with its decision in *Meritor*, the Court confirmed in *Ellerth* that the employer is strictly liable under the quid pro quo theory for a supervisor’s harassing or discriminatory actions that lead to significant changes in a person’s employment status. Moreover, consistent with its ruling in *Faragher*, the Court judged

that an employer could be held liable in situations where a supervisor causes a hostile work environment, even when the employee suffers no tangible job consequence, and the employer was unaware of the offensive conduct. That is, the employer may be liable where a supervisor causes a hostile work environment by his or her severe or pervasive inappropriate conduct, subject to an affirmative defense. Based on this case and *Faragher*, employers, both public and private, are best protected by developing and disseminating an antiharassment policy. However, if an employee has reason to fear retaliation for coming forward and using the policy, the employer is not able to use policy as an affirmative defense. The burden of proof for any affirmative defense rests on the employer.

In *Pollard v. E.I. du Pont de Nemours & Co.*, the Supreme Court ruled that the amount of “front pay” a victim may receive is not subject to the limit of \$300,000, established in 1991 for compensatory and punitive damages. The Court ruled that “when a court found that an employer had intentionally engaged in an unlawful employment practice, the court was authorized to award such remedies as injunctions, reinstatement, backpay, and lost benefits.” Based on this ruling, backpay, known today as “front pay,” includes the period between the date of judgment and the date of reinstatement.

In *Pennsylvania State Police v. Suders*, the Court held in an 8-1 decision that an employer can only be held strictly liable for a supervisor’s harassment if there has been an “official act” that accompanied an employee’s constructive discharge.^[25] While the Court did not clearly define the “official act” standard, the description of a tangible employment action as set forth in *Ellerth* is implied in the new standard, as well as “a humiliating demotion, extreme cut in pay, or transfer to a new position in which [a person] would face unbearable working conditions.”^[25] At the same time, the *Suders* decision provides employers with the opportunity to assert an affirmative defense to a claim of constructive discharge.

Defining employer liability for sexual harassment under Title IX of the Education Amendments of 1972: In the late 1990s, the Supreme Court ruled on two cases involving liability for sexual harassment in educational institutions. The first dealt with student–teacher harassment and the second with student–student harassment.

The 1998 Supreme Court case, *Gebser v. Lago Vista Independent School District*, concerned harassment of a student by a teacher.^[26] The Court ruled in a 5-4 decision that school districts were only liable for student harassment by teachers, if school officials knew of the problem and refused to intervene. In this case, when the school district discovered a teacher, Frank Waldrop, having sex with a student, he was arrested

and promptly fired. Prior to this incident, a group of parents had complained to the school about sexual comments Waldrop made in class, but these concerns had not been reported to the superintendent. Also, the school district had not promulgated or distributed a formal antisexual harassment policy or procedure for lodging such a complaint. The Court, however, viewed Title IX as a contractual framework, distinguishing it from “Title VII, which is framed in terms not of a condition but of an outright prohibition.” The Court was unwilling to subject schools to liability in absence of a clear directive from Congress. The Court voiced concern that the award of damages might unfairly exceed the amount of federal funding actually received by the school. The Court held that a school is liable for teacher–student sexual harassment only when someone with authority to take corrective action has received actual notice of the harassment and has exhibited “deliberate indifference.” In a strong dissent, Justice Stevens warned that the rule crafted by the Court might create a disincentive for schools to take steps to discover harassment and avoid liability through an “ostrich” defense.

In 1999, the Supreme Court tackled the question of a school district’s liability for harassment of a student by another student in *Davis v. Monroe*.^[27] LaShonda Davis was in the fifth grade when she first complained to her teachers that a student sitting next to her was sexually harassing her. Over a 5 mo period, the harassment took various forms, including offensive language, fondling, and sexual abuse. The student and her mother reported the encounters on numerous occasions both to her teachers and to the school principal. The school did not provide any protections to Davis other than, after 3 mo, changing her seat. After the school refused to take action, the child’s mother reported the situation to the sheriff’s department. The harassing student was charged with and, subsequently, pleaded guilty to sexual battery. The Davis family filed against the school district, because it took no disciplinary action to protect the victim. The Court found that the child was the victim of repeated acts of harassment over a 5-mo period and that the misconduct was severe, pervasive, and objectively offensive. Applying the standard set out in *Gebser*, the Court ruled that public schools can be sued and forced to pay damages for failing to stop sexual harassment by students, but only where the school district is cognizant of the incident and is “deliberately indifferent.” In addition, the harassment must be deemed so severe that it deprives the victim of access to educational opportunities or benefits provided by the school district.

The Supreme Court has provided guidance to employers about the parameters of sexual harassment and the conditions under which employers can be held

responsible. The Court has made a clear distinction about employer liability, depending on whether a case falls under Title VII of the CRAs of 1964 or under Title IX of the Education Amendments of 1972. Lee and Greenlaw project that the recent “rulings will lead to greater litigation in the realm of sexual harassment and may emphasize the need for some action by Congress and/or the Equal Employment Opportunity Commission.”^[10]

The EEOC: Providing Guidance and Enforcing the Law

The Equal Employment Opportunity Commission is the agency responsible for publishing regulations governing sexual harassment in the workplace and providing policy and enforcement guidance to help employers interpret and apply EEOC regulations, federal law, and judicial decisions governing sexual harassment.^[28,29] In 1980, the EEOC issued formal guidelines defining sexual harassment for all employers. According to the EEOC, sexual harassment includes “unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature ... when submission to or rejection of this conduct explicitly or implicitly affects an individual’s employment, unreasonably interferes with an individual’s work performance or creates an intimidating, hostile or offensive work environment.”^[30] In the workplace, two types of sexual harassment are legally recognized: 1) quid pro quo and 2) hostile work environment. Quid pro quo harassment is defined as a situation where a person demands or requests sexual favors from an employee in return for employment benefits, such as a promotion or salary increase, or as a condition of employment. When an employee refuses to succumb to sexual advances, the harasser denies the employee tangible economic or job benefits. Hostile working environment harassment occurs when behaviors create an offensive or hostile work climate, such as touching, sexual remarks, and overtures. For both types of harassment, the victim, as well as the harasser, may be of either gender, and the victim does not necessarily have to be of the opposite gender as the harasser.

Annually, the EEOC publishes its regulations about sexual harassment in Title 29 of the Code of Federal Regulations. The EEOC also produces policy guidelines to help employers interpret and understand judicial rulings. Recent policy guidance provided by the EEOC, for example, deals with the issue of employer liability in light of the *Burlington Industries* and *Faragher* Supreme Court decisions. In addition to formulating regulations and policy guidance, the EEOC can be involved in the investigation and prosecution of sexual harassment claims. Despite its

multiple roles, the EEOC has continually reiterated that all employers need a written antidiscrimination (including sexual harassment) policy.

FORMULATING A WORKPLACE POLICY

Employers are liable for sexual harassment in their workplace that they are aware of, unless they take prompt and effective actions to remedy the situation. Even if employers are unaware of the harassment, they are still potentially responsible. Employers may limit their liability in hostile work environment cases, by taking appropriate actions and providing avenues to employees to raise harassment complaints. According to the EEOC, “It is necessary for employers to establish, publicize, and enforce anti-harassment policies and complaint procedures.”^[29] Such policies must be in writing and disseminated widely to employees. At a minimum, a sexual harassment policy must address three objectives. First, the policy’s goal must be to prevent incidents of sexual harassment in the workplace. Second, the policy must encourage employees to report incidents as soon as possible so that the employer can correct the problem. Finally, the policy must be consistent with the applicable legislative and case law.

In light of these objectives and as suggested by the above-mentioned EEOC regulations and guide posts, an antidiscrimination policy should do the following:

1. Clearly define behaviors that constitute harassment.
2. Declare that behaviors defined as harassment will not be tolerated and are prohibited in the workplace.
3. Assure that employees who make complaints of harassment or provide information related to such complaints will be protected against retaliation.
4. Establish a formal complaint procedure within the organization that mandates a prompt, thorough, and impartial investigation of every complaint.
5. Provide for prompt corrective action, including appropriate disciplinary action if unlawful harassment has occurred.
6. Assure that the employer will protect the confidentiality of harassment complaints to the extent possible.
7. Include training and education to sensitize all employees to harassment issues and the organization’s policy.

An employer’s policy should prohibit harassment by all persons in and associated with the organization,

including supervisors, coworkers, and non-employees. Moreover, the policy should encourage employees to report harassment *before* it becomes severe or pervasive, so as to prevent its escalation to a level that violates federal law.^[29]

A successful prevention program requires that employers communicate their policies to employees in as many ways as possible, starting with a training and education program. The policy should also be included in the staff handbook, posted in the organization in places where staff gather and obtain news, and communicated orally during employee orientation. Moreover, the policy should be redistributed at least annually to employees and managers and whenever it is updated.

An important ingredient of a successful sexual harassment program, often not discussed in the literature, is the HR department. The HR department plays a critical leadership role in the development, interpretation, and communication of an organization's sexual harassment policy. Typically, HR professionals are responsible for translating legal doctrine, including recent judicial rulings, into workplace policy and training employees about sexual harassment. The HR staff schedule meetings with employees to discuss sexual harassment, convey management's disapproval of sexual harassment, and inform employees of their rights and the methods for lodging complaints of harassment. HR professionals serve as important resources for managers and supervisors who need to be able to respond to situations involving sexual harassment quickly and effectively. In addition, HR departments are involved in the receipt and resolution of sexual harassment complaints.

CONCLUSION

Sexual harassment is an issue that confronts managers in all organizations and is costly to all parties involved. Although employers cannot completely eradicate the risk of sexual harassment incidents, they can significantly limit their liability by properly designing and implementing a sexual harassment policy. The role of the HR professional is critical to the successful implementation of a sexual harassment policy and complaint procedure. The HR professional needs to understand the issue's significance, the hidden and direct costs of sexual harassment, the legal and regulatory policy environment governing sexual harassment claims, as well as the employer's preventive policy and investigative procedures.

Department of Political Science, National University of Singapore, Singapore

INTRODUCTION

Singapore attained self-government in June 1959, when the People's Action Party (PAP) government assumed office after winning the May 1959 general election and after nearly 140 years of British colonial rule. The PAP government has governed Singapore for 45 years as it was reelected for the 10th time in the November 2001 general election. This article contends that the nature of public administration in Singapore is shaped by its British colonial heritage, its policy context, and the policies introduced by the PAP government.

PUBLIC ADMINISTRATION UNDER THE BRITISH (1819–1959)

In 1947, the Trusted Commission, which was appointed to review the salaries and conditions of service of public services in the Malayan Union and Singapore, recommended that a Public Service Commission (PSC) be formed as the adapted version of the Civil Service Commission in Britain; and that the Singapore Civil Service (SCS), following the example of the British Civil Service, be reorganized and divided into four divisions according to the duties and salaries of its members.

There are four major features of public administration in Singapore during the colonial period. First, the SCS did not play an important role in national development during the colonial period as it was preoccupied with enforcing colonial rule in Singapore and with economic exploitation of natural resources from the region for the benefit of the home government in Britain. In other words, the SCS focused on performing the traditional “housekeeping” functions of maintaining law and order, building public works, and collecting taxes.

Second, the SCS neglected administrative reform as it was responsible for introducing only two reforms: the fourfold division of the SCS in 1947, and the creation of the PSC in 1951. As the PSC was formed to keep politics out of the SCS by rejecting the spoils system and to speed up the localization of civil servants, its establishment led to the introduction of meritocracy in the SCS.

Third, the SCS was afflicted by the problem of corruption during the colonial period. Corruption was

made illegal in 1871, when the Penal Code of the Straits Settlements was enacted. However, the first anticorruption law was only passed 66 years later in December 1937, when the Prevention of Corruption Ordinance came into force.

Fourth, the civil servants during the British colonial period were criticized for having “a colonial mentality and were insensitive to the needs of the population.” The PAP leaders had serious misgivings about the SCS as its localization had not contributed to a national bureaucracy. Accordingly, the PAP leaders were compelled to introduce comprehensive reforms to transform the SCS after they assumed office in June 1959.

THE POLICY CONTEXT

A brief description of the policy context in Singapore is necessary as it is an important factor influencing the nature of public administration and the performance of the SCS. More specifically, Singapore's smallness, multiracial population, and level of economic development, and the PAP government's predominance will be discussed.

In terms of size, Singapore is a city-state with a total land area of 682.7 km², or the same size as Lake Biwa in Japan. Although Singapore's smallness has enhanced policy implementation as the SCS does not encounter the logistical and communications problems found in larger countries, its small size also constitutes a constraint as there is no large rural hinterland for the cultivation of crops or the mining of minerals. Indeed, as Singapore has no natural resources, it has to rely instead on its strategic location, deep harbor, and people.

In June 2002, Singapore had a population of 4,163,700 (including foreigners who have resided for at least a year) and a population density of 6075 persons/km². The resident population of 3,378,300 persons is heterogeneous in three aspects. First, it is multiracial as the Chinese constitute 76.5%, Malays make up 13.8%, Indians constitute 8.1%, and other races make up 1.6%. Second, although the resident population speaks many languages and dialects, there are four official languages: English (the language of administration), Mandarin, Malay, and Tamil. Finally, in terms of religion, 54% of Singaporeans are

Buddhists and Taoists, 15% are Muslims, 13% are Christians, 4% are Hindus, and 14% have no religion.^[1]

The resident population's diversity in race, language, and religion imposes two obligations on those governing the city-state. The first obligation is the necessity for any incumbent government to formulate and implement policies that contribute to nation building and racial harmony. Second, the political leaders must minimize discrimination of any kind by ensuring that all public and private organizations are fair and impartial in the treatment of members of the public, regardless of their race, language, or religion. The rights of the minorities and religious groups are also protected by the Presidential Council for Minority Rights and the Presidential Council for Religious Harmony, respectively.

In 1960, Singapore was a poor country with a per capita gross domestic product (GDP) of \$443, a high unemployment rate, a serious housing shortage, and rampant corruption. However, the PAP government's success in promoting economic development, solving the housing problem, and curbing corruption has resulted in: a per capita GDP of \$20,850 in 2001;^[2] 85% of the population living in public housing today; and Singapore being the least corrupt Asian country and the fifth least corrupt country among the 133 countries included in *Transparency International's* 2003 Corruption Perceptions Index.

The PAP government's predominance in Singapore can be attributed to four factors. First, during 1965–1970, it succeeded in garnering the support of the people to deal with the challenges of the withdrawal of the British military forces and the building of Singapore's own armed forces with the introduction of compulsory military service in 1967. Second, the PAP government acquired legitimacy among the population because of its effective response to communist and communal threats. Third, the PAP government's predominance in Singapore politics can be explained in terms of its ability to deliver goods and services to the population during its 45 years in power. Finally, there is no creditable alternative to the PAP government as the opposition political parties are weak organizationally, poorly funded, and unable to recruit professionals as members.

PUBLIC ADMINISTRATION UNDER THE PAP GOVERNMENT (1959–2004)

Public administration in Singapore during the 45 years of the PAP government's rule is characterized by these six features: meritocracy, minimization of corruption, comprehensive administrative reforms, competitive salaries for political leaders and senior civil servants, effective policy implementation, and policy diffusion.

Meritocracy

The PAP government retained the meritocratic system introduced by the British colonial government in 1951 with the creation of the PSC. However, Prime Minister Lee Kuan Yew expressed his disdain for the former British reliance on seniority and favored instead an emphasis on efficiency as the basis for promotion. Consequently, competent civil servants were promoted to more responsible positions regardless of their seniority. This focus on efficiency rather than seniority is responsible for the relative youthfulness of many of the permanent secretaries today. Lee's emphasis on meritocracy and the need to attract the "best and the brightest" to join the SCS can be attributed to his experience as the legal adviser to several trade unions in Singapore in the 1950s before his entry into politics. He won all his legal cases against the British colonial government as its lawyers were incompetent and poorly paid.

Accordingly, Lee reinforced the PSC's role in maintaining meritocracy by controlling the quality of personnel entering the SCS. The "best and the brightest" Singaporeans are recruited by the PSC for the SCS by awarding scholarships to the best students of every cohort to obtain university education in Singapore or abroad. In his 1996 study of the Economic Development Board (EDB), entitled *Strategic Pragmatism*, Schein^[3] astutely observed that "having 'the best and brightest' in government is probably one of Singapore's major strengths in that they are potentially the most able to invent what the country needs to survive and grow and to overcome the kinds of biases and blind spots."

Minimization of Corruption

As corruption was a serious problem during the British colonial period, especially after the Japanese Occupation (1942–1945), the newly elected PAP government initiated its anticorruption strategy in 1960 with the enactment of the Prevention of Corruption Act (POCA), which increased the penalty for corruption and empowered the Director of the Corrupt Practices Investigation Bureau (CPIB) and the officers to investigate persons accused of corrupt offences. In 1989, the POCA was amended to enhance the penalty for corruption from 3 to 5 years imprisonment, and the fine was increased 10-fold from S\$10,000 (\$6000) to S\$100,000 (\$60,000).

The PAP government succeeded in minimizing corruption because it did not rely on the British colonial method of using the Anticorruption Branch (ACB) in the Singapore Police Force (SPF) to combat corruption. The ACB was ineffective in curbing corruption

as it was inadequately staffed and funded, and had difficulty in dealing with police corruption. The theft of S\$400,000 worth of opium by some detectives in the SPF in October 1951 forced the British colonial government to transfer the task of corruption control from the SPF to the CPIB in October 1952. However, the CPIB was ineffective during the next 8 years as its powers, personnel, and funds were limited.^[4]

The PAP leaders, especially Lee Kuan Yew, were committed to eliminating corruption in Singapore as they relied on the CPIB to impartially implement the POCA against corrupt persons in both the public and private sectors. Moreover, the POCA is constantly reviewed and amendments are introduced whenever necessary to remove any loopholes. In other words, the key to Singapore's success in combating corruption is the impartial implementation of the POCA by the CPIB and the public's perception that corruption in Singapore is no longer a "low-risk, high-reward" activity but a "high-risk, low-reward" activity.^[4]

Comprehensive Administrative Reforms

In contrast to the British colonial government, which neglected administrative reform, the PAP leaders initiated comprehensive administrative reforms after assuming power in June 1959 because of the favorable timing, their commitment, and the lower degree of risk in introducing reforms when compared with the maintenance of the status quo.

The timing was favorable for the PAP government to introduce major reforms as its assumption of power marked the end of nearly 140 years of British colonial rule. The PAP leaders emphasized both institutional and attitudinal reforms as they reorganized the SCS, established statutory boards, and changed the "colonial mentality" of the civil servants and their insensitivity to the population's needs. They were also committed to reform as manifested in their critical speeches in the Legislative Assembly on different aspects of the administration of the colony. The most important reason for the introduction of comprehensive administrative reforms was the PAP leaders' perception that the risk involved in not implementing the reforms was greater than the risk accompanying the implementation of the reforms.

The comprehensive reform of the public bureaucracy in 1959 involved these aspects: the formation of the Ministry of Culture and the Ministry of National Development; the creation of such statutory boards as the Housing and Development Board (HDB) and the EDB; the reduction of salaries of senior civil servants by discontinuing their variable allowances; and the establishment of the Political Study Center to change the "colonial mentality" of the civil servants.

In short, the PAP government initiated a comprehensive reform of the public bureaucracy in 1959 because it needed the support of the civil servants to implement its programs.

During its 45 years in power, the PAP government introduced these administrative reforms: the 1959 reforms; the POCA in 1960; the 1978 and 1989 budgetary reforms; the establishment of the Public Service Division as the second central personnel agency in 1983; the formation of the Education Service Commission and Police and Civil Defense Services Commissions in 1990; the establishment of the Service Improvement Unit in April 1991; the creation of a system of 31 personnel boards in 1995; the revision of salaries from 1972 to 1993; the benchmarking of the salaries of political leaders and senior civil servants to several private sector professions in October 1994; and the launching of Public Service for the 21st Century (PS21) in May 1995.

Competitive Salaries

As Singapore's economy grew in the 1970s, the higher salaries paid by the private sector led to a brain drain from the SCS, and civil service pay was increased to curb the loss of talent. In 1972, the National Wages Council recommended the payment of an additional month's salary to minimize the gap between salaries in the public and private sectors in Singapore. The salaries of the political leaders and civil servants were periodically revised in 1973, 1979, 1982, 1989, and 1993 to reduce the salary gap in the public and private sectors.^[5]

On October 21, 1994, a white paper on *Competitive Salaries for Competent and Honest Government* was presented to the Parliament to justify the pegging of the salaries of ministers and senior civil servants to the average salaries of the top four earners in six private sector professions. The white paper recommended the introduction of formal salary benchmarks for ministers and senior bureaucrats, additional grades for political appointments, and annual salary reviews for the SCS.

The adoption of the long-term formula proposed in the white paper has two advantages: it removed the need to justify "from scratch" every revision of the salaries of ministers and senior civil servants; and it ensured the building of an efficient SCS and a competent and honest political leadership, which are responsible for Singapore's prosperity and success. In short, the white paper institutionalized the PAP government's practice of "matching public pay to the private sector, dollar for dollar" as it enabled the government to revise automatically public sector salaries in response to increases or decreases in private sector salaries.^[6]

Thus, by periodically revising civil service salaries to keep pace with rising wages in the private sector from 1972 to 1993, and by benchmarking these salaries with some private sector professions from October 1994 onward, the PAP government has enabled the SCS to retain its talented personnel and also to maintain its quality service.

Effective Policy Implementation

The SCS and statutory boards in Singapore are effective in policy implementation because, once a policy is formulated, the government ensures its successful implementation by providing the required manpower, legislation, financial resources, and equipment to the implementing agencies. Apart from political will, the emphasis on meritocracy and competitive salaries ensures that the public bureaucracy is staffed with qualified and competent personnel. The CPIB's success in minimizing corruption has removed a serious obstacle to policy implementation as scarce resources are not wasted on bribes and delays are avoided. Finally, the small size of Singapore is conducive to effective policy implementation as the public bureaucracy does not face the same logistical and communications problems encountered in larger countries. A good example is the HDB's effective implementation of the public housing program, which resulted in increase of the proportion of Singaporeans living in public housing from 9% in 1960 to 85% today.

Policy Diffusion

Finally, the PAP government has relied on policy diffusion, or the borrowing of policy ideas and solutions from other countries and adapting these ideas and solutions to suit the context of Singapore. As it is unnecessary and expensive to "reinvent the wheel," the PAP leaders and senior civil servants consider what has been done elsewhere to identify appropriate solutions for resolving policy problems in Singapore. Those solutions selected will usually be adapted and modified to suit the local context. Schein^[3] has attributed the EDB's commitment to learning and innovation "to Lee Kuan Yew's and Dr. Goh's willingness to learn from other countries and from various non-Singaporean advisers, and is most clearly demonstrated in the continuous changing and refining of social policy."

Soon after the attainment of its independence in August 1965, Singapore looked at Israel and Switzerland as role models to provide inspiration for devising relevant public policies for defense and other areas.

Later, West Germany was added to the list for technical education, followed by The Netherlands (Schiphol Airport was the model for Changi International Airport) and Japan (for quality control circles and crime prevention). The critical lesson in these learning experiences is the adoption by Singapore of ideas that have worked elsewhere (with suitable modification to consider the local context, if necessary), as well as the rejection of failures in other countries.^[7]

In sum, policy diffusion in Singapore remains an asset if there is intelligent sifting of relevant policy ideas and solutions tested in other countries by the policy makers, who must avoid blind acceptance or wholesale transplantation of foreign innovations without modification to suit the local environment.^[8]

CONCLUSION

Public administration in Singapore is the product of its British colonial heritage, the constraints imposed by its policy context, and the various policies introduced by the PAP government during its 45 years in power. Indeed, the PAP government's success in transforming Singapore from a Third World state to a First World nation can be attributed mainly to its ability to attract the "best and the brightest" Singaporeans into the SCS. The high quality of Singapore's civil servants is manifested in the country's top ranking on the competence of public officials among 59 countries in the *Global Competitiveness Reports* of 1999 and 2000, and among 75 countries in the *Global Competitiveness Report 2001–2002*.^[9–11] In sum, Singapore's lack of natural resources has been overcome by the quality of its political leaders and civil servants, who are responsible for its rapid transformation and progress during the past 45 years.

Singapore: Economic Policy

Charles Conteh

Department of Political Science, McMaster University, Hamilton, Ontario, Canada

INTRODUCTION

This article seeks to throw light on the institutional properties and policy processes, through which Singapore has been able to employ corporatist models of state intervention in collaboration with business and labor in formulating and implementing policies that cater to the creation of a competitive and successful market system across the various phases of the country's economic development. The focus on institutional properties in this entry is a deliberate attempt to shift the discourse on Singapore's economic success away from the emphasis on the key role of the political leadership. While, no doubt, political leadership has certainly been important, the configurations of institutions and policy processes have not been given as much attention as they deserve in explaining Singapore's economic success.

Thus, the central focus is to understand the changing institutional and political mechanics that surround the rather complex partnership between the public and private sectors, within the framework of pragmatic economic management in Singapore, and the changing character of that partnership. Pragmatism refers to the mix of state economic planning and interventionism, characterized by a non-commitment to any particular ideological blueprint and more in tune with the creation, allocation, and management of resources, as necessitated by the expediencies of changing national development priorities and the imperatives of economic growth.

The article takes the following form: First, it presents a conceptual framework and brief theoretical review as a basis for the examination of Singapore's experience with economic policy formulation and implementation. Second, an analysis is made of key phases of economic development in Singapore over the past four decades, with the aim of putting in context the institutional and policy dynamics surrounding the government's active involvement or intervention in the country's economic development. Third, an attempt is made to throw light on the changing dynamics of state-business partnership, necessitated by the ever-changing imperatives of the domestic and international market, and, in turn, the implications that such changing partnership has for the state's present capacity to manage its interventionist model of economic development.

In light of the above, the following propositions about economic policy formulation and implementation in Singapore are examined throughout the rest of the article: First, the operational capacity of a country's administrative machinery, especially economic development agencies, in strategic partnership with private sector actors, significantly affects the long-term coherence, practical relevance, and successful implementation of economic development plans. Second, state intervention geared toward enhancing the capacity of the private sector necessitates a changing model of state-business partnership, as dictated by the imperatives of changing economic circumstances.

CONCEPTUAL FRAMEWORK AND THEORETICAL REVIEW

For the purpose of pragmatic economic management, state capacity comprises two dimensions: first, the existence of reasonably efficient administrative institutions responsive to political cues but at the same time *relatively free from—or able to resist*—the pressures and penetration of parochial and short-term special interests. Second is the *legitimacy* of the state and its administrative machinery in carrying out its interventionist activities within the market.

According to Max Weber, bureaucracy is necessary for state action. The existence of extensive, internally coherent bureaucratic machinery is an indispensable prerequisite for state intervention in pragmatic economic management.^[1] Moreover, in order for the state to engage in capitalist economic transformation, the workings of the administrative machinery must link up with the workings of the market. It is also important that key officials within the bureaucracy and public agencies share major assumptions and understanding of market variables and their interaction if the internal coherence of the state's intervention is to be maintained.

Furthermore, bureaucratic competence must coexist with some reasonable degree of policy autonomy, in order for the developmental state to translate its broad national goals into coherent and effective policy programs. In the absence of bureaucratic autonomy, public-private cooperation easily degenerates into situations in which state goals become directly reducible

to private interests.^[2] In this light, autonomy makes it possible for the state to coordinate the parochial and atomistic interests of private economic actors and alter the social and economic structure along the lines of its overall strategic development policies.

Although policy autonomy leading to internal organizational coherence and policy consistency is crucial for building and fully exploiting the technical capacity of bureaucratic agencies, nevertheless, this needs to be balanced by the imperatives of the state's external connectedness to the market environment and its main actors and interests if the intervention of the state is to remain relevant to the changing realities of the economy.^[3] This process could be referred to as market legitimacy, meaning the business community and organized labor's trust in the government's capacity-enhancing activities and programs, a recognition of the authority of agency officials and government bureaucrats to direct the trajectory of market transformation and a perception among these actors that the state's policies are consistent with their medium- to longer-term interests and overall economic development.

SINGAPORE'S ECONOMIC DEVELOPMENT IN PERSPECTIVE

Over the past four decades, Singapore has been transformed from having an economy based on staples export to one characterized by well-developed industrial and financial activities, with close integration into the global economy. The economy grew rapidly through two key stages between 1960 and mid-1990, and a third stage is presently unfolding.^[4] From staples export, the economy diversified into labor-intensive manufacturing, with the government's successful diversification of the economy toward financial and business services. As the economy matured and labor became scarce, the government further made a strategic switch to capital-intensive production around the turn of the 1980s. Singapore has enjoyed consistent exceptional growth rate, averaging over 7% GDP growth per annum, in the last 40 years, doubling its GDP about 11-fold.^[5] After the recession of the mid-1980s, the economy was set for yet another major restructuring that would direct Singapore toward its new vision of becoming a knowledge-based economy and an industrial hub in the Asia-Pacific region.

Unlike certain accounts that have merely stated that Singapore was well positioned at independence to benefit from global capitalism,^[6] it is necessary to explain how and why the state was able to redirect its society along this capitalist trajectory and take advantage of existing international economic opportunities. However, given that economic policy is a rather

broad subject, the analytical scope of this article is focused on industrial development policy, with a particular emphasis on the institutional and administrative implications for the most recent industrial restructuring over the past decade.

Seeking to understand the role of the state in the process of economic development requires an explanation of the nature of the state and its power, autonomy, and legitimacy vis-à-vis private societal actors, and how that affect the process of policy formulation and implementation. The significant question is not whether Singapore followed rational economic policy but why and how. Rather, it is about the processes that ensure that such "rational" policies are made and effectively implemented. The policies themselves are only reflections of institutionalized power relations among various actors.^[7] These institutions are, in turn, configured to deal with the imperatives of changing economic circumstances. Thus, the aim is geared toward an understanding of changing processes and power relations conditioned by wider socioeconomic variables and their impact on the selection and effectiveness of economic policies.

Since Singapore attained self-government on June 3, 1959, the government conceptualized national development in terms of its ability to respond to the material needs of its people and structurally transform their societies along the path of the newly adopted capitalist trajectory. Caught at the frontlines of communist-capitalist confrontation at the height of the cold war, Singapore's ruling People's Action Party (PAP) envisaged the country's socioeconomic destiny through a capitalist trajectory, thereby categorically rejecting communism in principle and perceiving economic development not merely as a goal but also as a question of national survival and identity. The domestic political and institutional processes, through which the Singapore government was able to delegitimize and exclude non-capitalist interests and directed the economy toward partnership with international capital (mostly multinational corporations or MNCs), will set the context for understanding the country's specific model of economic policy management. Moreover, it sets the context in explaining why the Singapore government chose to partner with MNCs as the key model for the country's economic development. It also put in perspective how the state was able to maintain the "acquiescence" of the local private sector (entrepreneur and labor alike), in their own marginalization, as significant participants in economic development.

The PAP was able to use strategic international concerns over the prevalent communist menace in the early years of self-government, to assert and consolidate its hold on power. Linking up with moderate labor unions within an alliance that seeks to strike a middle course (between the extremes of leftist

radicalism and rightwing conservatism), the PAP perceived that it had a sufficiently legitimate basis to embark on a systematic “liquidation” of any serious political opposition to its hold on power. Under the same “cloud” of the communist menace (both imagined and real), and armed with the overwhelming legitimacy provided by its alliance with moderate labor unions, the government was able to exclude and delegitimize more radical labor unions that were not inclined to follow the PAP’s path toward a pro-Western capitalist trajectory. It was the extension of this same logic of pro-Western capitalist trajectory that easily justified the PAP’s exclusion of local entrepreneurs who were showing sympathies for anti-Western sentiments.

Thus, the PAP created an artificial political stability and “social quiescence” as crucial foundations for building a socioeconomic infrastructure, characterized by instrumental rationality and elitist policy making in long-term strategic partnership with foreign investors.^[8] But the real “engineering” of the political context that shaped the atmosphere of economic policy formulation and implementation in Singapore was consolidated when certain institutions were created to give more concrete expression to the “middle road” of what could be referred to as strategic pragmatism of capitalist development. The Economic Development Board (EDB), established in 1961 to plan and promote economic development in the manufacturing sector, became the central agency responsible for market coordination and provision of incentive structures.^[9] Along with other agencies like the Jurong Town Corporation and the Urban Redevelopment Authority, the EDB maintained a long-term vision of market-capacity enhancement, by seeking to attract and build close partnerships with large MNCs.

A significant element of Singapore’s economic development strategy, therefore, is the strategic partnership between competent and autonomous agencies, led by the EDB, the multiple linkages between these agencies, and their close embeddedness within the market through consolidated networks with private economic actors.^[10] EDB’s partnership with MNCs, with its implicit exclusion of local enterprises, formed the overarching industrial development model that guided Singapore through the various phases of its economic development—at least until a decade ago, when serious economic and institutional reconfigurations started taking shape.

Another crucial institutional expression of Singapore’s economic pragmatism was the country’s corporatist “tripartite structure” of industrial relations management and market governance through the framework of the National Wage Council, consisting of state representatives, entrepreneurs, and labor unions.^[11] Over 90% of organized, unionized labor in Singapore has direct institutional affiliation with the

PAP-led National Trades Union Congress (NTUC). The head of the NTUC is a government minister. The most characteristic feature of the tripartite structure is that it provides a framework of labor management, through which dialogue between labor and capital is fostered, bargains are struck, and systemic long-term synergies are cultivated for economic development.

STATE CAPACITY IN INTERVENTIONIST ECONOMIC MANAGEMENT

One of the observations that have been made about Singapore is that the country inherited a strong administration and effective government from the British who governed Singapore until the country’s independence. This is not accurate because, in fact, the PAP government inherited an administration with significant structural weaknesses when it assumed power in June 1959. Fundamentally, the civil service did not have an orientation toward pursuing national development. Moreover, corruption was endemic in the Singapore public sector. The British generally neglected administrative reform. The PAP had to embark on a systematic and comprehensive reform and reorientation of Singapore’s Civil Service into a dynamic machinery of development administration.

However, a more notable feature of public administration in Singapore is the depoliticization of politics within the broader framework of policy formulation as a whole. Added to this was the strong belief of the ruling PAP in technocratic economic management, free from the uncertainties of interest politics.^[12] Through its subtle exclusion of local enterprise within the government’s EDB–MNC model of economic development, a potential political force was delegitimized from having any serious influence on the direction of economic development. Moreover, by effectively co-opting organized labor through the government’s NWC framework, a considerable constellation of labor interests as a political factor was “internalized” within the government’s calculus of opaque policy negotiation and “consensus” governance. This provides the government the dual advantage of “legitimizing” its active management of the economy and also reinforcing its operational autonomy from particularist interest articulation.

The operational autonomy of economic development agencies—and the civil service as a whole—extended not only to society at large but even to its own partners within the market. In its dealing with MNCs, for instance, the EDB maintains a close relational fusion with its MNCs partners but manage to keep a clear operational autonomy from their particularist interests. The success of this strategy was seen in

the fact that powerful economic interests could not deviate the state from its strategic thrusts along a certain direction. While the state remains sensitive to the needs and demands, the former was able to restructure the economy at will across critical junctures of its industrialization. It is no surprise then that Singapore has been rated repeatedly as having one of the most efficient and competitive public management systems in the world.

CHANGING DYNAMICS IN STATE-BUSINESS PARTNERSHIP

The focus of this section is to understand the policy and institutional and administrative implications involved in the recent strategic thrust over the last 10 yr toward a knowledge-based economy, with a focus on making Singapore an industrial hub in the Asia-Pacific region. A key part of this new thrust is an increasing realization that the old model of exclusive state partnership with MNCs will not sustain the country's long-term development within the region.^a As regional competition increases and international capital becomes more fluid, it is important that Singapore revisits its state-business partnership model.^[13] A result if this revisit has been the increased importance of more systematic inclusion of local enterprises into the state-business partnership.

This is not to say that local enterprise development is a new phenomenon, but that it is taking on more prominent place in the country's economic management strategy. Mechanisms such as market network linkages are being examined to cultivate closer cooperation between MNCs and small- and medium-size enterprises (SMEs). There are numerous schemes to nurture local enterprises into Singapore-made MNCs, with the capacity to engage more aggressively in the regional and even global economy.^[14] Some of the most popular SME schemes include the following: the Local Enterprise Finance Scheme; the Local Enterprise Technical Assistance Scheme; the Skills Development Fund; Corporate Advisers Programme; Micro Loan Programme; Technology for Enterprise Capability Upgrading; and Loan Insurance Schemes, among others. In general, Singapore has over 60 schemes to support SMEs.

There have also been increasing calls for the government to retreat from some of its productive activities in the market to make entrepreneurial room for more local businesses. In other words, the urgency of local enterprise is taking such a policy hold that local

entrepreneurs, policy think tanks (like the Institute for Policy Studies), and academics alike are becoming bolder in their call for the withdrawal of the once-revered government-linked companies from their "crowding out" activities in the market.

The implication of these recent developments is that institutional and policy coherence and continuity as understood in Singapore could be witnessing increasing strains. Even more significant is that within the arena of policy implementation, the institutional framework for economic management is undergoing radical reconfiguration, which is witnessing a fast redirection away from Singapore's signature strategy of one-stop service through the EDB for business development to multiple stops through not only a host of agencies under the Ministry of Trade and Industry but also other government ministries whose mandate may include something related to economic development.

Just to give a picture, in addition to the EDB and JTC, other agencies now responsible for assisting coordinating business development in Singapore include the National Computer Board (NCB), Trade Development Board (TDB), IDA (revamped), SPRING, EPC, A*STAR, STB, and STIF. Without dwelling on the meanings of all the acronyms of the above agencies and their functions, it is worth illustrating the complexity of the new institutional environment.

Agencies such as the NCB and the TDB, among others, were created (or older agencies have their mandates expanded) to cover the various sectors and sub-sectors, in managing the complex needs of a highly heterogeneous and specialized market. For instance, although the TDB had been formed as early as in 1983, it was a rather passive organization, since local enterprises were not a strategic part of Singapore's industrial policy. But after 1985, as the new economy takes shape and new policies emerge, giving greater attention to local enterprise development, the TDB was revamped into a proactive agency providing support to SMEs. Another example is the creation of SPRING, a relatively new agency that has been working with SMEs to develop intersectoral collaboration among local enterprises—what the agency calls "business fusion groups."

A significant implication of this strategic switch to multiagency approach is the challenge to institutional coherence and capacity that is being created by the multiplicity of agencies running various schemes in a complex and mature economy that is bent on going more regional. Part of this could be a function of the fact that as the jurisdiction and mandate of these various agencies develop and even duplicate each other, tensions and strains around cooperation are beginning to emerge. The clear leadership that the EDB was showing under the "old-order" economy is being eroded, as other agencies (such as SPRING) see their

^aFrom an interview with a senior official at the EDB, Singapore, at the EDB office on November 28, 2005.

primary mandate taking on more policy prominence within the new economy.

Local enterprises are already complaining that there is immense confusion over which agency does what. For instance, SPRING, as maintained above, has been working with SMEs to develop business fusion groups. One problem, however, is that while SPRING assumes greater and greater responsibility for the fostering of SMEs and even sees itself as a de facto "EDB" or central "nerve" for SME, its mission statement and the ranking of its priorities give the confusing impression that SME development is not the main function of SPRING. Instead, it has this vague statement claiming that SPRING seeks to "raise productivity," so as to enhance Singapore's competitiveness and economic growth for a better quality of life for Singaporeans. Just what this means in practical, operational terms remains unclear. Moreover, SPRING's relationship with the other agencies, including EDB, remains vague.

Another implication of this multiagency approach is the gradual erosion of state autonomy from societal penetration that state agencies once enjoy. Within their multiple and often duplicating functions, and the pressures of jurisdictional turf among agencies, the tendency toward increased porosity to the parochial demands of specific private sector interests cannot be overstated.^b It becomes less unlikely for these multiple agencies to lose sight of the overarching strategic goals and get focused on their specific mandates, with attendant sympathies for, and proximity to, their immediate clientele, relative to the broader and more abstract national goals.

Furthermore, as part of the institutional shift, Singapore's chambers of commerce and industry, as well as trade and industry associations (as representatives of local enterprises), have been incorporated into the policy arena of collaborative network partnership in governing the market. The implication here is that the character of market legitimacy of the state would require some reconfiguration under the new market arrangements. First, SMEs, unlike MNCs, have a much wider representation, very heterogeneous interests, thus requiring a more complex type of state-business partnership. This complexity is already being reflected in the move from the single agency to multiagency approach to business development.

Moreover, MNCs were essentially owned and run by foreigners in Singapore. Their approach to participation in policy formulation and implementation has the measured modesty and caution of "outsiders" within the political arena. Local entrepreneurs, on the other hand, do feel a greater sense of

ownership of the policy arena. The implication here is that the serenity and instrumental rationality of policy negotiation and implementation is beginning to witness a more convoluted process of widely heterogeneous demands and largely politically enfranchised interests, with higher expectations or demands on government agencies.

CONCLUSION

To put it in a nutshell, this entry has looked at the changing institutional properties and policy processes that characterize Singapore's corporatist model of state-market partnership. Using instruments of pragmatic economic management, the Singapore state has fostered strategic partnership with MNCs over the past 40 years with very successful economic outcomes. However, this model of exclusive partnership with MNCs is under strain, as the imperatives of industrial restructuring toward a knowledge-based economy necessitate a more systematic inclusion of local enterprises into the policy and administrative arena. Therefore, the institutional configuration toward increasing multiagency management of the economy, as dictated by the new direction of industrial development, is having some bearing on the state's capacity and legitimacy to effectively spearhead the pace and trajectory of economic development.

Social Networks

Brian E. Adams

*Department of Political Science, San Diego State University,
San Diego, California, U.S.A.*

INTRODUCTION

Social networks are the relationships between individuals or groups of individuals. These relationships could be formed through many channels, such as organizational membership, political activity, or recreational activity. A central characteristic of social networks is the presence of individuals known as “hubs” or “connectors” who have an exceptional number of links to various individuals and groups. These connectors reduce the social distance between disparate groups, forming bridges between groups that would not otherwise be connected.

Social networks are an important feature of community life that have a significant influence on the policy-making process. Social networks facilitate citizen involvement in politics, acting both as a mobilizing force and as a resource for citizens attempting to influence policy decisions. Further, they can potentially foster attitudes and dispositions, such as trust and norms of reciprocity, that build social capital and facilitate community cooperation in addressing social problems. However, networks do not always have the characteristics needed to promote these goals, and could act to limit the capacity of citizens to address public problems.

SOCIAL NETWORK STRUCTURE

A network is comprised of nodes—the things being connected together—and links, which connect the nodes. A *social* network is a network where the nodes are individuals (or groups of individuals) and the links are interpersonal relationships between them. Note that “social” here denotes that the network is comprised of people and their interpersonal relationships, as opposed to other networks where the nodes are inanimate object and the links are not personal relationships (such as the world wide web, where the nodes are web pages and the links electronic). Thus, social networks encompass more than just networks derived from “social settings.” It includes any set of individuals connected by personal relationships, regardless

of the context in which those relationships were formed.

Nodes in social networks vary in the number of links they have, i.e., some people have a greater number of relationships than others. Most social networks have a small number of nodes with many links, and many nodes with only a few links each. For example, in a group of 25 people, you may have one or two people who know almost everybody else, while most members of the group will only know a few others.

Nodes that have an exceptionally large number of links are referred to as hubs or connectors. For example, in our group of 25 people, the connectors would be the one or two people who know almost everybody else in the group. Buchanan refers to networks characterized by a few hubs with many links as “aristocratic” because they are dominated by a few nodes.^[1] “Egalitarian” networks, on the other hand, are ones where most nodes have about the same number of links. Buchanan uses this terminology to highlight the fact that when a few nodes have a disproportionate share of links, their importance, in terms of the functioning of the network, increases. Nodes also increase in importance when they have unique links to other nodes that make connections between otherwise unconnected groups. Thus, both the node’s number and the type of connections influences their importance and role within a network.

Hubs/connectors are important for three reasons. First, because they have so many links, they are the linchpins that hold networks together. If a network is dominated by a few major hubs, removing or incapacitating those hubs could undermine the whole network. For example, shutting down O’Hare airport, a hub of the air transportation system, would wreak havoc on that network, while shutting down a smaller airport with fewer flights would not. If you were to remove from a social network the handful of people that are the most well connected, the network would likely splinter into smaller networks, as parts of the network would lose connections to other parts. Because they have so many links, hubs significantly influence the boundaries and form of a network.

Hubs are also critical aspects of networks because they are central to their functioning. In the context of a social network, they facilitate the flow of resources and information through the network. This dynamic is aptly demonstrated by Gladwell in his book *The Tipping Point*.^[2] Gladwell argues that one way in which epidemics or fads take off is that a few “exceptional people” are responsible for spreading information or ideas. They are “exceptional” in the extent of their networks and their ability to use them. In other words, they are connectors. Information does not spread evenly or randomly through social networks; rather, it flows from connectors outward. Because they have so many links to a diverse array of individuals, they create the opportunity for information to flow from one group to another. The functioning of a social network as a conduit for information flows depends largely on the existence of connectors; without them, this task would be far more difficult.

Finally, connectors are important because they make the social distance between any two people within a network shorter. The number of nodes it takes to go from one node to another within a network is referred to as the “path distance” or “degree of separation.” In most networks, the path distance between randomly selected nodes is surprisingly small. For example, a study done by Stanley Milgram in the 1960s found that two randomly selected people in the United States can be linked through their social networks by an average of six people (although subsequent research has reached slightly different conclusions). One reason path distance is so short is because connectors provide links between individuals who otherwise would have no connection to each other. Because connectors have so many links, they are able to bring together nodes that are from different social worlds and otherwise would have no connection. This creates a “small world” phenomenon. By linking together so many different people, connectors significantly reduce the social distance between any two random people, thus allowing for the flow of resources and information across disparate groups that are otherwise not connected.

Hubs can compensate for a lack of network density, which refers to number of links between nodes; the more links, the denser the network. Thus, in a group of 25 people, if each person only knows one other person, it is not a dense network, while if everybody knows almost everybody else, it is very dense. When we think of the connectivity of a network, we typically do so in terms of density: the more links between people, the more highly connected the network. But density is not the only factor contributing to connectivity. A dense network of 25 people, if all the links are to each other, will lack connections to others outside of the immediate group. A less dense network could be

more connected (in the sense of having greater capacity to communicate with others) if it has a few links to hubs that in turn connect it to other groups. It is incorrect to assume that the networks that are most densely connected are also the most capable of performing desired functions, such as the flow of information or the sharing of resources. The *pattern* of links within groups and between groups is as important, if not more important, than the raw *number* of links between individuals.

TYPES OF RELATIONSHIPS IN SOCIAL NETWORKS

The nature of the links between nodes is also an important feature of social networks. The central distinction is between “strong ties,” which are links between personal friends, family, and others who know each other well, and “weak ties,” which are links between acquaintances or people who only know each other through a third person (e.g., a “friend of a friend”).^[3] In many cases weak ties are a more valuable resource than strong ties. For example, a job seeker may find weak ties to be more useful in generating leads than strong ties, since a person’s close friends and family are less likely to have information about jobs that the person do not already know about. Weak ties are valuable because they connect individuals with others who are from different social circles and thus have access to different resources and information. Strong ties, of course, are also important in that they represent strong interpersonal relationships that can serve as a foundation for social cohesion and cooperation. But in terms of individuals’ ability to gain access to information and resources through networks, weak ties are often more valuable.

Another distinction between different types of relationships in social networks is the difference between a “bridging” and a “bonding” network. Bridging social networks link together groups and individuals that are dissimilar in important respects, which form bridges between groups that otherwise would not have any connections. Bonding social networks tie together those who share commonalities and perhaps have connections in other contexts. Both types of networks are valuable: bonding networks can create social cohesion and group solidarity, while bridging networks reduce social distance and can enhance understanding and cooperation between groups (although critics argue that bonding social networks can also promote intolerant and insular communities). Connectors are the critical facilitator for bridging networks: they form the links that can tie together disparate groups. Bonding social networks, on the other hand, are more a function

of network density. Thus, the social function that network ties perform (i.e., bridging or bonding) is derivative of the structure of the network itself, in terms of density and the role of connectors.

The basic building blocks for social networks are, generally, clusters of individuals who form circles of friends, workplace colleagues, families, or political groups. How these small clusters are tied together into larger social networks significantly influences network dynamics. This is why connectors and weak ties are so important: because they are the links that assemble smaller clusters into larger networks, they have a tremendous impact on the manner in which networks operate. With fewer connectors and a dearth of weak ties, clusters are not likely to be as connected, thwarting the flow of information and resources through the network. With more hubs, and bridges between various clusters, networks become “small worlds” where the ability to communicate becomes much easier, even between socially distant clusters.

SOCIAL NETWORKS AND THE POLICY-MAKING PROCESS

Social networks are relevant to the policy-making process in three ways: they can mobilize citizens to participate, they can be used as a resource by citizens who are attempting to influence policy decisions, and they can create social capital, which in turn fosters attitudes and dispositions that can enhance a community's capacity to address social problems.

Mobilization

Social networks are a means through which citizens can be mobilized to participate in the policy-making process. Scholars examining political mobilization have made the distinction between *intentional* mobilization, which involves people directly asking others to get involved, vs. *unintentional* mobilization, which is when people hear about political activities through social networks, and as a consequence get involved even though there was no intent by anyone to mobilize them. With intentional mobilization, there are explicit efforts to draw on networks to engage other people. In unintentional mobilization, social networks facilitate the mobilization process by acting as a conduit for information, even though there is no explicit attempt to use them in this manner.

Whether it be intentional or unintentional, individuals with extensive social networks are more likely to be mobilized and hence participate in the policy-making process. The decision to participate is significantly influenced by whether an individual is asked

to participate by someone in their social network. As Rosenstone and Hansen put it, “citizens participate in elections and government both because they go to politics and because politics comes to them.”^[4] The extent of participation is not just a function of the attitudes and dispositions of citizens, but also the density and character of social networks in a community that can be used to prompt citizens to participate. Expansive networks that link together disparate groups can facilitate citizen participation, while networks that do not could constrain the ability of political actors to mobilize others.

Social Networks as a Political Resource

Social networks are key resources for citizens who desire to influence public policy. First, as just discussed, they can be used as a recruiting tool to mobilize other citizens to support one's effort. Social networks are also an important source of information about politics for citizens, who can use their networks to learn about the activities of government officials and other citizens, as well as acquire the “inside scoop” on political events. Conversely, they also are used to disseminate information that activists wish to make known throughout the community. Perhaps most importantly, social networks are a means through which citizens with similar political goals can find each other and pool their resources to pursue common objectives. In general, social networks are a resource akin to time, money, and civic skills that assist citizens in their efforts to influence public policy.^[5]

The Creation of Social Capital

Social capital is defined by Robert Putnam as the “connections among individuals—social networks and the norms of reciprocity and trustworthiness that arise from them.”^[6] In Putnam's usage, social capital includes both the networks themselves and the consequences of being embedded in networks, such as trust of others and adherence to democratic norms. Putnam focuses on social networks built through participation in community organizations (both political and non-political) because it is through these organizations where the benefits of social capital—the development of norms of trust and reciprocity—are most likely to develop. Putnam's central thesis is that participation in community organizations is declining, leading to a decline in the stock of social capital. Critics have questioned both Putnam's argument that civic participation is declining and the contention that a decline in civic participation will lead to a decline in social capital.^[7]

Scholars studying social capital hypothesize that being part of social networks formed through civic

engagement will lead individuals to be more trusting of other citizens and social institutions generally; interaction with others in the community will lead to a more positive assessment of society and fellow citizens. Involvement in community organizations is also hypothesized to instill democratic norms in individuals. Citizens who are active in community organizations will develop norms of reciprocity, become more tolerant of others' views, and be more public spirited. Survey research has found that there is a correlation between civic engagement and these hypothesized benefits. But the causation can work both ways: civic engagement could instill norms of trust and reciprocity, or individuals who already have these dispositions could be more willing to engage in civic activity.^[8] Thus, whether civic engagement really has the salutary benefits described by Putnam and others is still an open question.

CONCLUSION

Social networks are an essential part of political activity, which is fundamentally a group exercise. The nature and density of social networks that exist in a community can potentially have a profound impact on the policy-making process by influencing who participates, the effectiveness of citizen participation, and the dispositions of citizens toward the political process. While research has not conclusively demonstrated that civic engagement has all the positive benefits hypothesized, there is strong evidence that a community's social networks have important consequences for policy making and governance.

Special District Governments

G. Ross Stephens

Department of Political Science, University of Missouri-Kansas City,
Kansas City, Missouri, U.S.A.

INTRODUCTION

Special districts governments are the most numerous and the fastest growing type of local government in the United States. In 1942, there were 8299 districts, having declined from 14,572 in 1932 over the course of the great depression. Since 1942, they have increased steadily to 35,052 in 2002 (GC02-1-1), and they are expected to be about 35,500 by the year 2007 if recent trends continue (see Fig. 1).^a For the present, 1997–2002, they constitute 40% of all local governments. Moreover, not all public agencies called “districts” or “authorities” are special district governments. Many are semi-independent subordinate agencies of other local or state governments.^b

DEFINITION

The Census Bureau defines special districts as, independent, special-purpose governmental units (other than school district governments)^c that exist as separate entities with substantial administrative and fiscal independence from general-purpose governments. Special district governments usually provide specific services that are not being provided by existing general-purpose governments. Most perform a single function, but, in some instances, their enabling legislation allows them to provide two or more, usually related, types of services [GC97(4)-2 and GC02(4)-2].

To be classified as a special district, a local unit must have three characteristics: existence as an organized entity, governmental character, and substantial autonomy. These are not easy standards to apply, because they are subject to varying practices in different states:

1. *Existence as an organized entity*: This means the presence of some form of organization, corporate powers such as perpetual succession, and the right to sue and be sued, to make contracts, to acquire and dispose of property, and so on. Districts are designated in law as “public corporations” or “bodies corporate and politic.” To be counted as a separate government, they must receive revenue, conduct activities, and have corporate officers.
2. *Governmental character*: This characteristic is indicated where the officers are elected or appointed by other state or local government officials or where other government officials serve as district officials in an ex officio capacity, and, also, where there is a degree of public responsibility indicated by the requirement for public reporting or election of officials. Governmental character is attributed where the district has the power to levy taxes or service charges,

^aMost of the data used are taken from the 1957 through the 2002 *Census of Governments* or from data provided to the author from the Governments Division of the U.S. Bureau of the Census, Washington, DC. These citations, for example, GC02(1)-1, stand for the 2002 *Census of Governments*, Volume 1, “Government Organization,” Number 1, Government Organization.

^bThere are literally tens of thousands of subordinate, semi-independent state, and local agencies that are sometimes called districts or authorities or a variety of other names that appear to be similar to special districts but do not meet all of the Census criteria for listing them as separate governments. As of 2002, the number of types of subordinate agencies ranges from 20 in Hawaii to 266 in Louisiana. One-third is under the aegis of the state, with the remainder being local. Under the state government, there are from eight in Kansas and North Dakota to 86 in Louisiana. Most of those under the aegis of state government are local or regional in character. The number of types of local subordinate agencies range from four in Hawaii to 180 in Louisiana. They are often used to take a service and its finances off-budget. Of the types listed, some have only a single unit, whereas others may have dozens or hundreds of units. A total of approximately 3458 types are listed by the Census [GC02(1)-1] of which 1149 are state, and the other 2321 are local, i.e., county, municipal, township, joint, or tribal. The average state has 23 types at the state level and 46 local. The District of Columbia has 12. This tabulation excludes similar local entities for elections and the administration of justice. The total number of these entities probably exceeds the total number of special district governments in the United States. Since 1962, the number of types of these subordinate agencies has been growing more than twice as fast as those classified as independent special districts. The existence of these agencies makes the structure of local government even more atomistic and amorphous.

^cSpecial districts and authorities must be distinguished from school districts, the other usually single-function type of local government. School districts provide K through 12 and sometimes community college public education, though at times they are also responsible for library services.

Fig. 1 Growth in the number of special district governments, 1932–2002, with estimate for 2007. (Data for 1932 through 1952 taken from Ref.^[1]; for 1957 through 1997 and 2002, GC02-(1)-1, from Ref.^[2].)

issue debt paying interest that is free from federal taxation, and/or perform a function that is generally considered a governmental activity.

3. *Substantial autonomy*: Autonomy means that the unit is substantially free from the supervision of other local units and the state, is free to set its own budget without strict review by other local governments and the state, and can largely determine the level taxes and service charges it levies. Additionally, administrative independence is considered if the governing body is elected, or represents two or more other local governments, or, if the governing body is appointed, it performs functions that are different from those of the appointing governments and are not subject to specifications by the creating governments. It should be noted that some states make a technical distinction between special districts and authorities, with special districts being capable of levying taxes and authorities operating on service charges.

Use

Special districts exist in all 50 states and the District of Columbia, with the 2002 numbers ranging from one in the District of Columbia, 14 in Alaska, and 15 in Hawaii to 2245 in Texas, 2830 in California, and 3145 in Illinois. The average state has about 700 special districts and authorities. Most, 91%, provide only a single function, while the remainder may provide two or more services. They perform virtually every service associated with government and some that are more commonly considered the role of private enterprise.

Though the numbers can vary from 1–3 to over 20, on average, they have a five-member governing board that may be elected, appointed, ex officio, or some combination thereof. Fifty-three percent of the governing

board membership is elected, with most of the remainder appointed, usually by other local governments or the state, though some are officials of other local governments or the state and serve ex officio. As of 2002, an estimated 180,000 individuals serve on the boards of special district governments.^d At the same time, these are governments that are largely *hidden* from public view. In other words, they largely operate below the level of public, media, and scholarly attention. Axelrod called them “shadow governments.”^[3] District elections rarely draw much voter attention, and the turnout is usually minuscule even by the low levels of voter participation that are normally associated with local elections.

Why, then, are there so many districts, and why do they provide such a variety of activities? First, they are usually created to provide a service or tap a revenue source not available to other local governments. For the 1987 and 1992 *Census of Governments* years, 93% of the variation in the use of special district governments is explained by the degree of state centralization and the level of activity on the part of other local governments. Stated differently, they are more likely to be used extensively where the state-local system is more decentralized and/or there is a lower level of services provided by other local governments. In other words, they are used to fill in the service gaps left by other local units and the state government.^[4] In Wisconsin, for example, townships can create coterminous township sanitary districts in order to provide this service, issue bonds, levy service charges, assessments, and a property tax [GC97(1)-1, A-273]. Foster blames private developers for the creation of many special districts, in order to obtain and control services for their projects.^[5]

Writing in 1957, Bollens noted that many special districts have been created, because existing governmental units have been found to be unsuited to present-day needs because of small area, lack of authorization for specific services, weak financial position, faulty administrative structure, antagonism, unresponsiveness, or resistance on the part of the officials of existing governments.^[6] Federal promotion, expediency, and clientele promotion (the desire to “free” a service from politics) are also factors (247–252).

Another aspect of their use is that they are often flexible in terms of the territory they serve—they can be created to serve larger or smaller geographic areas than those of existing local governments. Some districts provide one or more services to a metropolitan

^dSome of this information is based on the 1992 Census report on “popularly elected officials” [GC92(1)-2] and extrapolated to 1997 and 2002, given the increase in the number of special districts. To date, the Governments Division has not issued this report for 2002.

area. Further, they can often provide a service or services that are not authorized for existing local governments such as townships or counties.

A further reason for the creation of so many special districts is the policies of federal and state governments and, in some cases, the availability of grants-in-aid or shared revenue to fund their activities. Road districts have been created in some areas to receive a share of state revenue from taxes on motor vehicles and motor fuel. Fire protection districts in some states receive a share of state taxes on fire insurance. The U.S. Department of Agriculture stimulated the establishment of nearly 7000 special districts, providing drainage and flood control, soil and water conservation, and other natural resource activities. Federal policies and grants supporting planning, housing, and community development encouraged the establishment of nearly 3400 housing and community development districts. Other federal and some state policies have directly or indirectly encouraged the creation of other districts providing sewerage, water supply, solid waste management, as well as services related to transportation and transit.

Finances

Special districts are often used to fund new public facilities. Some districts, such as those for the construction of public school buildings in Indiana and Pennsylvania, are established specifically for the purpose of funding new facilities. In FY 2002, capital outlay accounted for 21% of district expenditures, which is almost twice the proportion of that for other local governments that average 11%. Even though special districts have less than 11% of local revenues and expenditures, they account for 21% of local government indebtedness, with over 89% of the 2002 debt of \$218 billion being the responsibility of the 1757 largest districts [GC02(4)-2].

Of the \$122.1 billion spent in FY 2002, no single function stands out as dominant, given the wide range of activities performed by special district governments. Leaving out utilities, the largest single function performed is hospitals at \$17.8 billion. Next is housing and community development, at \$12.4 billion, over four-fifths of which is paid for by federal grants. With expenditures of \$48.2 billion, utilities comprise two-fifths of all district expenditures. Nearly \$19.4 billion is for transit, \$17.6 for electric power, \$11.1 for water supply, and almost \$1.1 billion for gas utilities (see Fig. 2).

In FY 2002, total revenue amounted to \$123.7 billion. Well over half of all revenue, \$67.5 billion or 54.6%, is in the form of charges for services rendered such as hospitals, sewerage, and utilities. Taxes

Fig. 2 Special district revenue by source and expenditures by function, 2002. (From Ref.^[8].)

brought in only 11.9% of total revenue, mostly from property and sales taxes. Intergovernmental revenue comprised one-fourth of district income at \$31.4 billion. This is 13.1% from the federal government, 6.9% from the state, and 5.4% from other local governments. At 80.0%, four-fifths of all district revenue comes from charges for services and utilities and from other governments [CG02(4)-2]. Foster distinguishes between districts that have the taxing power and those that operate on service charges, though quite a few have the ability to levy both.^[5]

For the 40-year period between 1957 and 1997, special district expenditures increased 723% in 1997 constant dollars compared to an increase of 301% for other local governments. In these terms, special district revenues rose 796%, as contrasted to an increase of 303% for other local governmental units. This was a period of time during which there was a large increase in the population of metropolitan areas and, in particular, major increases in suburban and fringe area residents in need of services that were not always being provided by general-purpose local governments.^[7]

In 2002, nearly \$28 billion, 21%, of all district revenue were spent by special districts in California. Texas, Illinois, and Florida districts each raised and spent about \$8 billion, with those in Pennsylvania close behind at nearly \$7 billion. Districts in Hawaii spent

only \$21 million. Five percent of these entities, 1757 large districts (defined as those that either raise or spend \$10 million or have a debt exceeding \$25 million), accounted for 82% of the revenue and were responsible for 83% of all district expenditures. The average district the Census classifies as smaller raised \$663,000 and spent \$612,000, but some of the smallest spent only a few hundred dollars. Transit and transportation districts in Los Angeles, Chicago, New York, Boston, Philadelphia, Washington, DC, and Los Angeles county raised or spent from \$1.2 to \$3.0 billion each, as was the case with Arizona's Salt River Project and the Southern California Metropolitan Water District.^[8]

Functions

While some special districts provide multiple functions, the overwhelming majority provide a single function (90.9%). Almost 7000 are natural resource districts, classified as drainage and flood control, soil and water conservation, and other natural resources. Many single-function entities, such as those for housing and community development (3399), water supply (3405), along with sewerage districts (2004), the multifunction sewerage and water districts (1446), as well as the natural resource districts, have been promoted by federal policies and federal grants. The most numerous single-function types are the 5725 fire protection districts (see Table 1). A study

Table 1 Function activities of special district governments, 2002

Function	Total number of districts	Percent of total
Single-function districts		
Natural resource districts		
Drainage and flood control	3,247	9.3
Soil and water conversation	2,506	7.2
Other natural resources	1,226	3.5
Other single-function districts		
Fire protection	5,725	16.3
Water supply	3,405	9.7
Housing and community development	3,399	9.7
Sewerage	2,004	5.7
Cemeteries	1,666	4.8
Libraries	1,580	4.5
Parks and recreation	1,287	3.7
Health	753	2.1
Highways	743	2.1
Hospitals	711	2.0
Education	518	1.5
Air transportation	510	1.5
Gas and electric utilities	485	1.4
Solid waste management	455	1.3
Industrial development and mortgage credit	234	0.7
Other transportation	205	0.6
Welfare	57	0.2
Other and unallocatable	1,161	3.3
Subtotal, single-function districts	31,877	90.9
Multiple-function districts		
Sewerage and water supply	1,446	4.1
Natural resources and water supply	102	0.3
Other multifunctional	1,627	4.6
Subtotal, multifunction districts	3,175	9.1
Total, all districts ^a	35,051	100.0

^aThe one district in the District of Columbia, the Washington Metropolitan Area Transit Authority, is not included. (From Ref.^[12].)

by the U.S. Advisory Commission on Intergovernmental Relations found that fire departments were able to obtain funds from about 50 different federal grants.^[9]

Some 19,252 or 55% of all special districts operate without paid personnel. In other words, they have no employee who represents a 0.5 fulltime equivalent (FTE), which the Census Bureau counts as one paid employee. This is, at least partly, due to the fact that districts are often used simply as a financing mechanism for some new facility such as street lighting or school buildings. Most of these zero FTE units contract out for the services they provide, while the 58% of zero FTE fire protection districts use only volunteer personnel. Libraries and gas and electric utilities, at about 9% zero FTE, are the least likely to contract out or use volunteers in the performance of the services they provide. As of 2002, zero FTE special districts existed in every state, with a range from one in Alaska and 11 in Hawaii to 1300 in California and 1878 in Illinois. In fact, another four states (Kansas, Nebraska, Pennsylvania, and Texas) have from 900 to 1250 of these zero FTE units. Research by the author for the 50 states indicates that there is a high correlation between FTE personnel per unit of population and activity on the part of special district governments.^[2,7,10,11]

Evaluation

Special districts have long been criticized by scholars for adding to the proliferation of local governments and the continuing confusion as to which local government is responsible for a particular area of public policy and the provision of whatever local public service is of concern.^[3,13–15] There is seldom any service or financial coordination among districts and between districts and other local governments. While most of the large numbers of districts concerned with natural resources are located in rural areas, many other types of districts are within the confines of metropolitan statistical areas (MSAs). At least 43% are located in MSAs, while the overwhelming majority of the 1757 special districts the Census classifies as large are located in MSAs [GC02(4)-2, 50–70].^[5] No one knows how many are located in the 575 micropolitan statistical areas.^[16]

As of 1997, 19 county areas in the United States have 100 or more special district governments, all located in or adjacent to MSAs. They ranged from 100 in Fairfield County, Connecticut, to 445 in Harris County (Houston), Texas.^c Moreover, Harris County, at 280, has more zero FTE districts than any other

county area in the country, most supposedly involved in the provision of sewerage and water services. The eight-county Houston consolidated metropolitan statistical area (CMSA) has a total of 741 special district governments; 60% of these districts operated as zero FTE units. Eight county areas with over 100 special districts were located in California, three in Illinois, two in Texas, and one each for Colorado, Connecticut, Nebraska, New Mexico, New York, and Pennsylvania. The total number of local governments in these county areas ranged from 125 in Fairfield County, Connecticut, to 547 in Cook County (Chicago), Illinois.

In terms of services provided, taxes, and service charges, it is highly problematic whether even a minority of residents of metropolitan areas are aware of which government is providing or funding a particular public service or public facility. In fact, counting all types of local governments, as of 1997, there were 79 county areas in the United States, with more than 100 local governments. It is fairly clear that special districts contribute significantly to the balkanization of local government. Over time, the massive increase in the number of districts makes it even more difficult for the public to hold government accountable for the delivery, overall quality, and the financing of public services. Even without considering the thousands of semi-independent districts, the situation with special district governments magnifies the incomprehensible maze of local governments in the nation's metropolitan areas. Sometimes, such confusion exists in the nation's 575 micropolitan statistical areas (microMSAs).^c

Notwithstanding the growth in the use of special districts, this device for the provision of public services raises a number of questions and long-standing concerns. Some of these concerns relate to an inherently undemocratic structure. Only a little over half of the members of governing boards are elected, usually with a minuscule number of voters participating. Other governing board members serve *ex officio* or are appointed by other local governments, the Governor, or the state legislature. In 1965, nearly four decades ago, Martin, in *The Cities in the Federal System*, criticized the use of special districts:

It serves to separate the programs in question . . . from the mainstream of city politics, thereby denying it the juices of democracy . . . [I]t may serve only to substitute for the general politics of the city the particular politics of a special clientele. This exchange is of dubious advantage, the more because special district politics are less visible, less public, than general government politics.^[14]

Martin was right in the sense that special districts are *hidden governments* that operate largely below

^cThese data are not available for 2003 from the Census Bureau. MicroMSAs range in size from about 12,000 to 171,000 residents.^[16]

the level of public, media, and even scholarly attention. More recently, Burns pointed out that:

Simply living in one of these districts does not qualify an American citizen to participate in the district's politics. Unlike other kinds of governments, special districts can have property qualifications for voters. In 1973, the Supreme Court ruled that special districts are exempt from the one-person, one-vote requirement placed on other local governments.^[15]

Burns might have added, where the governing board serves ex officio or is appointed by the Governor or other local governments, that they are at least one more step removed from the political process. Not only may a special district have property qualifications, but, in a few instances, the vote is weighted by the amount of land (area) owned by the voter. Axelrod is highly critical of special districts, which he calls *shadow governments* and what he describes as their nefarious activities.^[3] He contends that not only are they a diminution of democracy, but also they elude the scrutiny of elected officials, are often mismanaged and corrupt, and may be a convenient pork barrel for wealthy private interests. Further, he notes that they are the product of a contradictory political culture that demands public services of local governments but refuses to pay increased taxes, so they are provided on a fee for service basis.

Districts are inordinately involved in the provision of system-maintenance services such as fire protection, sewerage and water services, drainage and flood control, mass transit, roads and airports, and mass transportation. This device has not proved viable in responding to social problems such as crime, drugs, and poverty associated with our core cities and inner suburbs. On the other hand, special districts deliver or provide the financing for capital intensive system-maintenance services. They are able to surmount geographic, political, and financial barriers associated with many, if not most, general-purpose local governments. In metropolitan areas, they often can deliver a service or a combination of services on a regional or semiregional basis, thereby overcoming the limitations of municipal, township, or county boundaries. In some cases, they cross state lines. They may, thereby, even be capable of achieving economies of scale in the provision of selected services.

Special districts are often used as a mechanism to overcome the financial constraints, tax, and debt limitations, placed on other local governments by state laws and constitutions. Given these constraints, special districts have proven to be a viable financial mechanism through which it is possible to issue bonds, levy user fees, property taxes, and special sales taxes for the provision of capital intensive services. Special districts

make extensive use of service and utility charges as a source of revenue, and the proportion spent on capital outlay is nearly twice that of other local governments. Even though district revenues and expenditures are less than 9% of the total for local governments, they account for nearly one-fourth of all local government debt. At the same time, they are responsible for almost 33% of locally owned public utility revenue and over two-fifths of locally owned public utility expenditures.^[8]

CONCLUSION

The special district mechanism has proven to be attractive, as it offers a politically feasible alternative for the provision of specific services to two or more municipalities or townships, or even on occasion, for a metropolitan area, without changing the political structure for existing local governments. They can also be downscaled to provide a service to a small area within a municipality or county, where the service in question is not needed in other parts of the existing local entity. While these hidden governments clutter up the political landscape, operate largely without public scrutiny, and almost universally lack effective public representation, special districts are playing an increasing role in the American polity.

Stage Heuristics in Policy Sciences

Christine R. Martell
Peter deLeon

*Graduate School of Public Affairs, University of Colorado at Denver and
Health Sciences Center, Denver, Colorado, U.S.A.*

INTRODUCTION

This entry develops the relationship between the concept of policy sciences^[1–3] and their relevant stages—a common heuristic of the policy sciences. In concert, they offer a unique approach to problem solving. The first part of this entry develops the evolution of the underlying assumptions of the policy sciences while the second sets out an analytic framework of stages derived from the policy sciences as a means of viewing policy decisions. Finally, the third part offers observations about the challenges the policy sciences and the stages face in policy analysis.

THE EVOLUTION OF THE POLICY SCIENCES

The development of the policy sciences approach has generally been ascribed to the works of Harold D. Lasswell^[1–3] and his colleagues soon after the end of the Second World War. The stated purpose of the policy sciences was to improve the quality of information offered to government and, by so doing, to improve the quality of governance itself. But the ontogeny of advice to the ruler goes back to virtually the beginning of recorded history, when people wondered as to the application of knowledge to the public sector to much the same end.^[4] Certainly the priests of antiquity were actively involved in political decisions, as kings would ask them to divine (and possibly sway) the “mood” of the gods prior to battle or even before a royal nuptial.

By the eighteenth century, the Age of the Enlightenment infused Western Civilization with a belief in absolute certainty that—through study and reflection—a rational or absolute “truth” covering a wide range of subjects, including politics, could be discerned and acted upon. The Progressive Era in the United States at least partially mirrors the purported marriage of good science and good government,^[5] even if politics and their administrations were somehow considered by some to be mutually exclusive.

The socio-political history of the twentieth century contributed in a sustained way to the movement of higher education (i.e., universities) into the realm of social application. The First World War saw the

emergence of psychology as a means to help winnow recruits for the American Expeditionary Force. The worldwide and sustained traumas of the Great Depression brought economics into virtually every government office. The horrors of World War II fascism made it apparent that governments could easily be used for ill purposes as well as good. This realization was especially clear for Lasswell, who spent the wartime years studying propaganda in the Library of Congress.

THE POLICY SCIENCES FRAMEWORK

Beginning in the late 1940s,^[1,2] Lasswell began to sketch out the thrust of the policy sciences with three clear and abiding components that differentiated them almost radically from the traditional research canons as practiced in higher education. Specifically, the policy sciences were meant to be:

- *Problem-oriented:* That is, they were intended to address problems of significant social import rather than those of strictly academic concern. The policy sciences would not address the number of angels dancing on the head of any given pin, but rather the causes and alleviations of social unrest and inequalities. In Lasswell’s words,^[2] “The Policy [Sciences] approach does not imply that energy is to be dissipated on a miscellany of merely topical issues, but rather that fundamental and often neglected problems, which arise in the adjustment of man in society are to be dealt with” (p. 14).
- *Multi-disciplinary oriented:* Lasswell^[2,3] saw the problems of the “real world” as having multiple “explanations,” such that in almost all cases, the application of a single discipline—be it law or psychology or sociology or economics—would be an unnatural constraint and excessively narrow in scope, and therefore, in all likelihood, it would fail to reveal the complete scope of the problem or its resolution. This tenet, of course, violated the entire departmental structure of the contemporary university, which by this time was disciplinarily focused on increasingly narrow research topics.

- *Explicitly normative*: The effects of the Enlightenment were most apparent in the exposition of and general adherence to logical positivism, a “scientism” that neglected the role of norms and values and ethics in social decisions (Social Darwinism and logical positivism are examples). This was the situation in social sciences such as economics, psychology, and behavioralism in political science. Yet Lasswell was certain that norms had an explicit place in policymaking and needed to be emphasized in the policy sciences.

The third of these hallmarks was explicitly spelled out by Lasswell as he and Abraham Kaplan^[6] articulated that the policy sciences were designed to provide “intelligence pertinent to the integration of values realized by and embodied by interpersonal relations [such as] human dignity and the realization of human capacities” (p. 15). More specifically, Lasswell wrote that “the policy sciences of democracy [were] directed towards knowledge needed to improve the practice of democracy,”^[2] thus enshrining the normative concept of the “policy sciences of democracy” (p. 15).

Two additional features of the policy sciences were their emphases on contextuality and the policy process. The first referred to the concept that no policy research could be conducted without a thorough understanding of the inherent contextuality of the problem—in other words, what were the conditions leading up to the recognition of the problem and in what environment did the problem exist? While this concept is certainly important in a world in which the policy sciences emphasize social problems, it does lend itself to a fundamental, endemic concern of the policy sciences: if all knowledge is dependent upon the overall environment in which a problem exists, that naturally relegates a general *theory* of the policy sciences themselves to a secondary position.

Lasswell also indicated a framework for understanding the events of (what he termed) the “policy process.” Formally posed in 1956, it has become the touchstone of most research in the policy process; many authors^[7–9] have formulated their texts around the process and numerous others have written on the various stages. As posed by Brewer and deLeon,^[7] the stages are:

- *Initiation*: The recognition of a problem, an understanding of what goals (e.g., political, economic, and normative) are to be sought, and the preparation of possible options to attain these goals within their constraints.
- *Estimation*: The balanced assessment of the “costs” and “benefits” (broadly defined) characterizing the various policy options to be delivered to government policymakers.

- *Selection*: The stage in which decisions addressing the problem are made by the policymakers (generally, but not always and surely not exclusively) on the prior analytic work.
- *Implementation*: The stage in which the chosen option is put into practice (usually by administrators, but more recently through the nonprofit sector) such that the programs have an effect on their intended recipients.
- *Evaluation*: The stage in which the program is assessed from a retrospective vantage point, its various aspects are evaluated, and when and where necessary, changes are made in the program and its implementation.
- *Termination*: In some cases, the final stage in the policy process, in which a program (for a number of reasons) is seen to have lost its effectiveness and is therefore terminated.

It is important to recognize that this framework (some have called it a “heuristic,”^[10]) is not presented as a formal “model” nor does it assume any predictive capabilities. Instead, it is a framework for understanding and structuring a particular problem for analysis and, as such, it serves a significant purpose.^[11] Moreover, its stages are clearly interactive with multiple feedback loops between them, rather than necessitating a linear, lock-step progression.^[7]

THE STATE OF THE STAGES

While the stages continue to be used as a framework for understanding the policy process, as witnessed by recent publications, there is no shortage of critique of their use.^[4,11–13]

Most prominent among the critiques of the stages as they apply to policy analysis are that they lack causal power and an hypothesis testing basis, they neglect the role of ideas, and they fail to account for policy-oriented learning.^[14] DeLeon and Martell^[13] concur that the policy sciences poorly incorporates active policy learning: “In many ways, policy analysis failed to marshal the evidence that policymakers could have gleaned from past policy failures, suggesting a bigger human challenge to the policy sciences” (p. 27). The policy sciences assume an environment with a pluralistic democracy and may have less application in other forms of democracies and political cultures.^[15]

Others frame their critique of the use of stages and policy sciences in reference to a learning curve. Radin^[16] considers the historical use of the policy sciences to be a growth industry, whereby the policy sciences are increasingly used as the framework diffuses over time. DeLeon^[4] views the historical evolution of the policy sciences in terms of lessons learned,

largely due to overwhelming policy failure. The lessons are that policy initiatives must be consonant with policymakers' requirements, that the policy sciences must respond to complexity and implementation design, that the policymakers and analysts need to frame the right questions, that good analysis in the policy sciences tradition cannot be separated from values (core values, morals, and ethics), and that analysts need to reflect the required political will.^[4,13]

It is in the context of previous failures and critiques of the policy sciences and stages that this discussion proceeds. First, we summarize prescriptions that have been offered to improve the policy sciences and stages in policy analysis. Second, in light of these prescriptions, we consider what improvements can be made at each stage of the policy process. Finally, we conclude by addressing some issues that to date are unresolved.

Summarize Prescriptions

If a central problem is how to reconcile the policy sciences and stages with Lasswell's normative, value orientation, deLeon and Martell^[13]—based on the work of Fischer,^[17] Forester,^[18] Hajer,^[19] Dryzek^[20,21] and Roe^[22]—recommend integrating a postpositivist perspective into the policy sciences to deal with diverse, interconnected, value-laden policy issues. The main advantages of this strategy would be in providing *understanding* of a relationship, providing a wider context to a policy issue, and understanding of the policy process.

This view is analogous to Lasswell's prescription of a "decision seminar," but often it is not followed in practice to carry out a multi-dimensional analysis of a policy issue. Even if perspectives offer divergent views of an issue, examining a policy problem from different lenses "illustrates how a policy problem is multi-faceted, with each perspective introducing a host of issues. The more that the perspectives introduce issues, the more policy goals become multi-dimensional and the acceptable solutions necessarily become multi-disciplinary" (p. 4).

Improve Stages

Given these prescriptions and the various critiques of the policy sciences, each of the stages could be shored up to honor the potential value of the policy sciences.

- *Initiation*: Needs to be coordinated around the right issue at the right time to the right person/agency. In this sense, policy analysts need to consciously widen the parameters of question definition, explore multifaceted understandings of a problem, and accurately frame issues.

- *Estimation*: Needs to incorporate negotiation, mediation, and resolution as a means for settling or at least framing value disputes.
- *Selection*: Needs to apply learning from past experience and broaden the parameters so that contradictory opinions are not excluded.^[23]
- *Implementation*: Needs to recognize that policy design is crucial to the success or failure of most policies.^[24,25]
- *Evaluation*: Needs to account for intended and unintended consequences, including distributional effects. Policy analysts should evaluate how a chosen issue frame affects outcomes and be conscious of whose values are attended and ignored.
- *Termination*: Needs to recognize that termination may occur because of shifts in values, norms, ethics, or political will. Termination becomes a policy choice even if a specific program is functioning as intended.^[26]

Irresolvables

In spite of the added value the policy sciences have offered the policy analysis world, any discussion would be remiss to neglect the following troubling questions related to the problems of integrating the policy sciences with a value orientation. The problem arises in how to make use of two paths—the predictive product of a positivist approach and the understanding of a postpositivist approach, neither of which is epistemologically flawless.

Would a postpositivist approach to initiation and estimation better align or wedge apart analysts' supply with policymakers' demand? If postpositivist methodologies bring more citizen input to the analyst and open the analysis beyond the standard option set (Initiation and Estimation), then would it also further divorce the usefulness of analysis and the role of the analyst, from the policy maker who is driven by political will? For the policy sciences to be an effective framework, do values and political will have to be the same thing? Alternatively, what shape and what types of relationships should policymakers, analysts, and citizens have with each other? Is it possible for the policymaker to acknowledge, respect, and respond to the values put forth by citizens? If so, would that happen via a policy analyst intermediary or best through direct democracy?

Another unresolved issue about the policy sciences framework is "whose" values. Lasswell, deLeon, and others speak of the importance of norms and values. What the policy sciences fail to do is present a reliable framework for whose values, thus neglecting the power dimension that underlies the importance of postpositivist thought. The prescriptions only guide that values

should be identified, and they provide no guidance on *how* to evaluate values of competing perspectives or persons.

The policy sciences, manifested in the stages, continue to offer a framework with which to understand policy. It is argued that the usefulness of the policy sciences for understanding multifaceted, complex, interconnected, value-laden problems is best enhanced with additional elements for a postpositivist orientation. It is also acknowledged that greater discourse and participation does not guarantee that analysis done according to the policy sciences framework will identify the “right” values nor, of course, does it promise the political acceptance of such arguments. It may, however, allow for the appropriate discussion of the tradeoffs of competing values. While the positivist perspective is necessary for the more tractable problems, the postpositivist perspective aids in understanding. Both resources serve policy analysis and should be used as the research problem dictates.^[27]

Standard of Award

Frayda S. Bluestein

*School of Government, University of North Carolina at Chapel Hill,
Chapel Hill, North Carolina, U.S.A.*

INTRODUCTION

The standard of award is an important aspect of the competitive bidding process in the public procurement process. Indeed, public procurement may be best known for its reputation as requiring the purchase of poor-quality goods or services under the “low bid” standard for awarding contracts. Whether or not this reputation may have been deserved at one time, a review of modern laws and regulations illustrates that the public procurement process has evolved into a much more quality-focused endeavor than is reflected in that common perception. Many public agencies include performance and quality requirements in specifications, coupled with a more generous standard for awarding contracts in order to secure responsible and responsive contractors through the competitive process.

OVERVIEW

The standard of award for public contracts may be found in federal, state, and local laws and regulations. The specific wording of the standard delineates the scope of authority a public agency has in awarding contracts that are subject to the bidding requirement. The standard of award determines what factors the agency may consider in choosing the successful bidder, and it affects the rights and remedies of the bidders who participate in the process. Examples of the wording that is used in standards of award include “lowest and best bid,” “lowest responsive and responsible bidder,” “responsible offeror whose proposal is determined to be the most advantageous to the [agency],” and “lowest bidder.”

In general, a standard of award that contains qualitative or subjective terms, such as “best,” or “most advantageous,” or a standard that specifically authorizes consideration of factors such as responsibility, quality, or performance, provides greater discretion to the awarding authority than a standard of award that requires only the lowest bid, without consideration of other factors. The trend in public procurement is to allow greater consideration of factors such as quality and performance over time, rather than strictly purchase price.

The standard of award may have several components—responsiveness, responsibility, and cost.

RESPONSIVENESS

Many standards of award incorporate the requirement that bids must be “responsive.” The requirement of responsiveness is implicit in the bidding process, even when not specifically stated as a part of the award standard. While the legal standards affecting the award of contract vary considerably among jurisdictions, the standard for determining responsiveness is nearly universal. A responsive bid is one that conforms substantially to the specifications and the invitation for bids and will, if accepted, form the basis for an enforceable contract (see Ref.^[1]). Responsiveness is a threshold determination in the bid evaluation process that each bid must satisfy in order to be eligible for award.

The public procurement process allows the public agency to accept bids that contain minor variations from specifications. These variations may be waived as long as the waiver does not give one bidder an advantage that is not enjoyed by the other bidders.^[2,3] This standard is generally enforced by administrative or judicial review, which may be sought by a bidder who is disadvantaged by the improper waiver of a deviation from specifications. While the requirement of responsiveness helps guarantee that bids will meet the needs of the agency as set forth in the specifications and invitation for bid, the need for fairness in the competitive process is also promoted by the responsiveness standard as enforced by the courts. The limitation on the ability of the agency to waive substantial deviations from specifications provides protection for the bidders who participate in the competitive process by ensuring that the terms of the solicitation are not, in effect, changed to the benefit of a particular bidder.

RESPONSIBILITY

Another term commonly found in standards of award is “responsibility.” In selecting the lowest “responsible” bidder, public agencies may consider “the bidder’s experience, skill, ability, business judgment, financial situation, integrity, honesty, possession of the facilities

necessary to perform the contract, previous conduct on similar contracts, reputation and record for reliability, as well as any other factors reasonably relevant to a bidder's successful performance if awarded the contract.''^[4] The awarding authority generally has broad authority to require bidders to submit information necessary for the agency to evaluate issues of responsibility, including financial statements, references, and records demonstrating capability and experience.

Some jurisdictions require that when a contract is awarded to a bidder who was not the lowest bid, the agency must provide the low bidder with notice of the decision and, in some cases, an opportunity for a hearing and to present evidence (see Refs.^[5,6]). This may reflect a concern that a determination as to the responsibility of a bidder may implicate the bidder's constitutionally protected due process rights. Judicial decisions have held that the bidder may be entitled to due process if a governmental agency's determination that the bidder is non-responsible would tarnish the bidder's business reputation and limit the bidder's liberty to pursue his or her chosen trade (see Ref.^[7]). Whether a particular decision implicates the liberty interest is not always clear, but the practice of providing notice and an opportunity for hearing may protect against potential claims under this theory. It may also help support the public agency's decision in the event it is challenged as being arbitrary or otherwise unlawful.

COST

A key purpose of competitive bidding is to ensure the prudent use of public funds in the procurement of goods and services. As such, it is important that the evaluation of cost not be limited to mere purchase price (see Ref.^[3]). Specifications and standards of award may incorporate consideration of value over the life of the goods or course of service, as well as considerations of quality, appropriateness, and usefulness for the desired purpose. In order to ensure fairness, however, the requirements of the agency and the bases for evaluation of cost and quality must be set forth in the specifications or other solicitation documentation. When a public agency awards a contract to a bidder who has not submitted the lowest bid, the basis for the decision should be documented by the awarding agency.

DISCRETION IN AND JUDICIAL REVIEW OF CONTRACT AWARD DECISIONS

An important issue that arises from the particular wording of a standard of award is whether or to what extent the standard allows the public entity to award a contract to a bidder whose bid does not offer the

lowest price. In evaluating the degree and type of discretion the awarding authority may exercise in evaluating bids, courts look to the specific wording of the standard of award. In some cases, a statute, regulation, or ordinance may list the specific factors that may be considered, such as inspection, testing, quality, workmanship, delivery, and suitability for the particular purpose. More commonly, the legal standard uses broader terms, such as quality and performance, which must then be interpreted. A narrowly worded standard, such as a "low bid" standard, may allow rejection of a low bid only if it is non-responsive or is otherwise ineligible for award. A more broadly worded standard may allow the agency to choose a higher-priced bid that offers a higher quality or performance to the agency. In such cases, the burden will generally be upon the agency, in the event of a challenge, or as part of the statutorily mandated procedure, to document the basis for the decision. In some jurisdictions, it is necessary for the agency to establish that the lowest bidder is not responsible, before an award may be made to the next lowest bidder.^[8]

The amount of discretion afforded by the standard of award also affects the extent to which a court, upon review in the event of a legal challenge, may scrutinize the agency's support for its decision. The greater the discretion afforded to the awarding authority in the standard of award, the more difficult the prospects for a disappointed bidder's challenge. When applying a standard of award that contains subjective standards, the awarding authority must exercise judgment, to which a court, in the event of a challenge, is likely to defer. This places a high burden on the challenger, who may be required to demonstrate fraud or an abuse of discretion in order to invalidate the award. A typical standard of review, as enunciated courts, is that the court will not interfere with the decision of the public agency unless the decision is arbitrary, made in bad faith, or constitutes an abuse of discretion.^[1]

The degree of discretion contained in the standard of award has been a factor courts have considered in determining what rights and remedies, if any, a bidder has with respect to the bid evaluation and award process.^[9] While in a few jurisdictions, a hearing and protest procedures are explicitly provided for by statute or regulation, others require recourse to judicial interpretation for guidance about bidders' remedies. Though most courts recognize a right to injunctive relief (allowing a bidder to seek a court order declaring the process invalid), it is more rare for courts to award lost profits or damages to disappointed bidders. Some courts have explicitly denied such recovery on the theory that because of the discretion involved in the contract award process, the complaining bidder has no legitimate claim that he or she would have been awarded the contract (see Refs.^[10,11]).

CONCLUSION

The standard of award, and its lawful application, reflect the dynamic tension in the dual purposes that underlie competitive bidding requirements in public procurement. These requirements are designed to promote value and economy, as well as fairness in the contracting process. In awarding contracts, public agencies must not exceed the degree of discretion afforded by the applicable standard of award, but must also apply to the best advantage of the agency the concepts of quality and responsibility. Finally, decisions must be documented in order to ensure fairness and promote openness in the contracting process, as well as to provide legal support in the event of a challenge.

Standards of Conduct

Jeremy F. Plant

*School of Public Affairs, Pennsylvania State University at Harrisburg,
Middletown, Pennsylvania, U.S.A.*

INTRODUCTION

Standards of conduct are statements about right behavior intended to guide the actions of individuals within organization, public jurisdictions, professions, or other bounded social institutions. Standards of conduct are usually justified by relating them to norms and values derived from religion, philosophy, political principles, law, or custom and tradition. They often include methods of enforcement and penalties for non-compliance. Standards of conduct have two common characteristics, whatever their basis and wherever found: They relate to the role performed by the individual within an organization or public jurisdiction and apply regardless of who occupies a position; and they are an effort to guide actual behavior, not just to identify basic norms and values.

DEFINING STANDARDS OF CONDUCT IN PUBLIC ORGANIZATIONS

Defining standards of conduct in public organizations raises several fundamental questions. What are the acceptable standards of conduct? Who shall determine what they are and by what authority? How will the standards be communicated to the members of the organization? What, if any, means of enforcing compliance with the standards will be used? Will standards state the minimal acceptable behavior or prescribe lofty goals or standards that may be hard to measure and attain?

One approach to defining standards of conduct rests on well-accepted parameters of behavior defined as corruption or corrupt acts. Corruption is usually proscribed by law and includes such behaviors as acceptance of items of value, bribery, nepotism, gross conflicts of interest, plagiarism, or conspiracy to violate laws or to prevent officers of the law from doing their work. In recent years, sexual harassment has been added to the list of actions deemed corrupt. Corrupt acts are such blatant violations of standards that they usually rest on unquestioned legal and moral bases.

Efforts to create a professional and non-partisan public service in the United States identified politics, especially partisan politics, as the major source of

ethical problems. The desire to insulate professional administration from political interference led to strict rules separating the realms of politics and administration. A central feature of such standards is the non-involvement of career administrators in political elections. In the reform movement that gave birth to modern public administration, this was a way to prevent partisan politics from interfering with the application of professional management techniques to governance. The Hatch Act, enacted in 1939 and substantially amended several times but still in force, addressed the problem somewhat differently. Its supporters saw in the growing numbers and influence of career public administrators, a possible political force that could wield undue power or disrupt democratic processes.

A second major source of ethical problems is the indistinct line between the public and private sectors. Taken together, these major sources of ethical problems have produced a bias in the United States toward formal standards of conduct that stress the need for political neutrality and the elimination of potential conflicts of interest as individuals move between public and private life.

More difficult to establish are standards of conduct that adapt general moral principles to the work of the public sector and to life in large, complex organizations. Standards of conduct defining corrupt behavior proscribed by law for a large, general population of individuals (e.g., all federal workers, or state and local employees in a state civil service system) may be of little help in guiding behavior of individuals who are trying to understand the nature of right action in complicated organizational and programmatic settings. For this reason, formal codes of conduct or codes of ethics, which have as their intent the application of general rules or values to the workplace, have become increasingly common in recent years.^[1]

CODES OF CONDUCT AND ETHICS IN PUBLIC ADMINISTRATION

Codes of conduct have a long history in the public sector. One of the longest-running uses of a code of conduct is that of the International City/County

Management Association (ICMA), which first established a code in 1924 and has adapted it several times since to meet changing conditions. Federal employees were first covered by a code in 1958, established by concurrent resolutions of Congress and strengthened by President John F. Kennedy by executive order in 1961. In the past three decades, states have been active in codifying standards of behavior for their employees, with around 40 states now employing some sort of code to identify standards of conduct. Local governments have also been active in promulgating codes of conduct.^[2] Professional associations whose membership is composed of public officials, in part or in toto, are another active source of codes specifying right behavior.^[3]

No single factor or explanation accounts for the wave of codifying permissible behavior that has swept over the public sector in the past quarter century. Declining faith in government or in bureaucratic organizations, media attention to corruption in political life, the fear of government power, demands of political elites for high levels of administrative accountability, and the use of codes by professions to increase their power in society have all been offered as reasons for the growing interest in identifying standards of conduct in public life. Codes are often adopted or modified in response to a specific scandal or problem, oftentimes without regard for consistency or logic. Whatever the impetus to codify is, codes are rarely if ever based on solid empirical evidence suggesting that the problem of corrupt or unacceptable behavior is increasing or posing a serious threat to the integrity of society.

BUREAUCRACY AS THE BASIS OF STANDARDS OF CONDUCT

Large, formal organizations have long been seen as a way of promoting ethical conduct and discouraging unethical behavior. Organizational structure can be a mechanism for ensuring compliance with ethical standards, especially those requiring accountability to higher authorities, transparency of decision making, and procedural fairness.^[4] In recent years, such organizational devices as internal audit units, ethics committees, ombudsmen, and ethics hotlines have increased the capacity of many public organizations to monitor the actions of individuals.

Organizations are also seen as a source of unethical behavior. Rules intended to guarantee fairness and accountability may become a means for individuals to avoid responsibility for their actions or may become ends in themselves, without concern for the higher values they are intended to promote. Organizations may develop a culture that allows ethical indiscretions to be overlooked or even provides reinforcement for

unethical behavior. The complexity of organizational processes may make it difficult for individuals to see how their work contributes to organizational goals—or why an occasional ethical lapse may have consequences outside the organization.

Standards of conduct that address proper interpersonal relationships within organizations, and between members of an organization, clients, and citizens, are increasingly common in both the public and the private sectors. They often stress the need for civility toward others and may identify types of language and behavior that are likely to be considered offensive to others. Harassment of others on the basis of sex, sexual orientation, race and ethnicity, age, or physical attributes such as appearance or weight, may be proscribed by explicit organizational rules or be inferred from general statements of expectations for civil behavior within the organization.

Unlike business, public administration has few standards of conduct that are developed by a single organization. Most standards result from efforts to codify right behavior for all organizations within a political jurisdiction (e.g., the Commonwealth of Pennsylvania, or the U.S. government). Others may be borrowed from professional groups that have members outside, as well as within a particular organization.

PROFESSIONALISM AS THE BASIS OF STANDARDS OF CONDUCT

Professionals are those individuals who apply expert knowledge, usually gained through higher education and often guaranteed by licensure, in the performance of their work. Professionals have become pervasive in the public sector; their presence in the public workforce requires altering traditional ideas of personnel policy, organizational control, and standards of conduct.

Professionalism affects standards of conduct in many ways. Professionals share a common identity, which is based not just on shared knowledge but also shared norms and values. They interact on a regular and lasting basis, often through associations that represent their interests and serve as a forum to share knowledge, insights, and experience. Professionals often are guided and governed by codes of ethics that apply general norms of right and wrong behavior to the work context.

Professional codes of conduct may exist independent of general ethics laws or public codes enacted by political institutions, or they may be required as a condition of public employment. They differ from codes promulgated as law or executive order by political institutions in several important ways. They often represent a voluntary commitment by the individual to

adhere to norms and acceptable behaviors. They may be enforced in ways established by the profession itself (e.g., committees established by a professional group to hear complaints and fix penalties, such as disbarment by a state bar association). They attempt to translate general ethical principles of right action to the context of the work performed. They may attempt to preclude even the appearance of wrongdoing, or include statements of ideal behavior, to increase public trust and confidence in the profession.

Professional associations representing well-established and specialized occupations usually find it easier to develop codes and apply them consistently than do associations that bring together individuals of varying educational and professional backgrounds. The American Society for Public Administration (ASPA) has had a code of ethics since the 1980s, but questions linger about its efficacy in actually guiding behavior. The ASPA represents students, academics, and practitioners, and it is hard to find common language to guide the actions of such a disparate audience.^[5]

DEMOCRATIC VALUES AS BASIS OF STANDARDS OF CONDUCT

Standards of conduct derived from professionalism focus on the meaning of general ethical principles in the application of knowledge to work situations. The particular obligations of public employment require that attention be given to standards of conduct derived from democratic values. This requires that fundamental principles of democratic governance be identified and translated into norms of conduct that guide the behavior of public administrators.

Beginning in the 1960s, an important body of literature in the field of public administration has addressed the problem of standards of conduct derived from democratic principles. Three major streams of thought have emerged. The first is based on the writings of John Rawls and is concerned with the advancement of the basic principles of liberty and social justice. A second stream looks at American constitutionalism as the basis of overarching principles to guide administrative behavior. The third approach focuses on individual virtue and the behaviors derived from virtue in the context of democratic governance. Virtue in public service requires a commitment to benevolence, honor, compassion, and trust in others.^[6]

Standards of conduct based on democratic principles often rest on commitments to basic concepts such as liberty, equality, and fairness. The challenge facing makers of codes is to find ways to operationalize such general democratic concepts to guide behavior and to deal with the trade-offs between conflicting values (e.g., the arguments for and against affirmative action,

based on differing notions of freedom and equal treatment).

Kernaghan argues that public service values should be the basis of codes.^[7] Kernaghan studies values statement in four Westminster nations (those with a British form of parliamentary government); Canada, Australia, New Zealand, and the United Kingdom. Based on his research, he identified four categories of public service values: ethical, relating to the integrity and fairness of individuals; democratic, relating to the rule of law, accountability, openness; professional, concerned with effectiveness, quality, and excellence; and people, for whom caring, tolerance, decency, and benevolence are expected in the behavior of public servants. Kernaghan suggests that the success of the values statement is related to the importance given to it by leaders, who should be exemplars of the values they expect to be integrated to the work of public organizations.

STANDARDS: PROSCRIPTIVE OR PRESCRIPTIVE?

A debate continues among scholars and practitioners on the relative value of standards of conduct that state explicitly what an individual may not do—*proscriptive standards*—vs. standards that state aspirational goals, or *prescriptive standards*. Closely associated with this debate is the related issue of whether standards and codes of conduct should be enforced, or should they simply rest for their implementation on the voluntary acceptance of those to whom the standards are addressed.

Example: One goal of standards is to encourage individuals in the public service to develop trust and confidence in others. Is it better to promulgate a code that pledges one to work actively to foster trust in the public service, or to pledge one to do nothing that will lessen trust in the public service, or to develop a series of specific constraints (e.g., dollar limits on gratuities that can be accepted or behaviors that can be considered conflicts of interest)? The first approach is clearly affirmational and prescriptive; the second is prescriptive but stated in less positive or idealistic terms; the third is proscriptive and based on a more negative view of human nature.

Example: The ICMA has had a working code of ethics since 1924. The ICMA code has been revised several times, including the addition of guidelines to help members understand the application of rules in typical work situations. The code is enforced by committees of ICMA members, with several types of sanctions that can be imposed. By all accounts, the membership of the association takes the code very seriously as a guide to action and as a statement of the values and norms that unite the profession. In 1987,

the association added a declaration of ideals that balances the negative, proscriptive nature of the code of ethics with a statement of the need for ICMA members to be committed to humane, equitable, and democratic values. While not enforceable, the declaration of ideals reinforces the commitment of the profession of local government management to the broad goals of democratic governance.

DO STANDARDS OF CONDUCT GUIDE ACTIONS?

How standards and codes of conduct actually guide behavior has become a major issue of concern for the field of public administration.^[8] For standards to influence behavior, the standards have to be promulgated in a timely and effective manner and explained in such a way that they are of use to decision makers. Training sessions may be required to show the application of standards in work situations. The literature on public-sector ethics is not clear on how well public administrators understand standards of conduct or how strong a factor they are in actually producing desired behaviors and attitudes.

Criticism of legalistic approaches to standards of conduct remains strong, even as more and more jurisdictions are adopting such requirements. Much of the criticism rests on the understanding that the work of public administrators involves judgment and discretion and cannot be fully programmed by formal standards. In this view of governance, it is necessary to inject administrative discretion with a sense of obligation to democratic values, as difficult as it may be to stipulate exactly what they require in actual work situations or how they may be enforced.

Others argue that individuals must exercise their ethical standards in the workplace on a regular basis, through actions that involve judgment and responsibility.^[9] Individuals should be shown how their actions relate to broader ethical and democratic values. The development of mature ethical judgment is shown to be of value to the organization, the public, and the individual by virtuous leaders who themselves inject the details of work with informed ethical actions. Through such examples, subordinates are given a better understanding of what it means to be ethically aware. This leadership by example can work with or without explicit codes or standards of conduct.

Final assessment of the importance of standards of conduct, in whatever form they may appear, rests on the added value they provide in democratic

governance. If they help individuals to understand better the organizational, professional, and systemic importance of adhering to consistent ethical behavior, they will lead to more efficient and effective performance and enhanced public trust and appreciation of public affairs. If they inhibit or stifle reasoned ethical judgment, or provide a convenient way for politicians to scapegoat career public administrators for failures of policy, or if they convince qualified individuals not to pursue careers in the public service, their costs will clearly outweigh any benefits they may provide.

State Administration of Mental Retardation and Developmental Disabilities Policies

Paul J. Castellani

*Department of Public Administration and Policy, University at Albany,
State University of New York, Albany, New York, U.S.A.*

INTRODUCTION

There are several key issues for states in the administration of services for people with developmental disabilities. These issues involve defining the scope of responsibility; controlling the high costs of developmental services; determining whether to administer developmental services separately or, if not, under which alternative framework; designing substate mechanisms for managing a complex array of publicly and privately provided services; and dealing with federal court decisions affecting states' ability to limit access to Medicaid-funded services.

responsibility in this area. Few state administrations (or substate entities) employ single-point-of-access mechanisms that apply uniform criteria defining disability. Moreover, determining eligibility, assessing need, and establishing priorities for access to services are key decisions often left to the private agencies that deliver developmental services. This translates into wide variations among (and often within) states in the numbers and types of individuals served and the costs of these services.^[1,2]

CONTROLLING THE HIGH COSTS OF DEVELOPMENTAL SERVICES

The closure and downsizing of large state-operated institutions and creation of community-based residential and day programs was the most prominent feature of developmental services in the field since the 1970s. Federal funding, primarily through Medicaid, underwrote much of the costs of this transition, supporting the remaining large institutions, as well as financing a substantial proportion of the community programs—the former as large Intermediate Care Facilities for the Mentally Retarded (ICFs/MR) and the latter as small ICFs/MR. Community day services, such as day treatment facilities, clinics, and other programs, were also reconfigured to qualify for federal financial participation.^[3,4] More recently, this federal funding has shifted from the ICF/MR program to the Home and Community-Based-Services (HCBS) waiver.

Medicaid is the primary source of funding for developmental services, and its share of the overall costs of Medicaid is large and growing. Of the approximately 36 million people in Medicaid, about 1.7 million are those with developmental disabilities—4.9% of the total—and triple the approximately 506,000 people with developmental disabilities receiving Medicaid in 1975—2.3% of the 1975 total. Medicaid recipients with developmental disabilities (4.9% of the total) account for 15.7% of total federal-state Medicaid spending.^[1] Controlling the large and growing cost of developmental services has been a central concern for both state and federal budget officials and policy makers.

DEFINING THE SCOPE OF STATE RESPONSIBILITY

The prevalence of severe mental retardation in society (approximately 0.7% of the population) means that states must administer programs for numerous individuals and their families. This is an important issue for state administration because developmental disabilities, by definition, manifest themselves at birth or early in life, are lifelong, and usually involve comprehensive and costly services. Although mental retardation is the most prominent of the developmental disabilities (usually accounting for about 80% of a broad definition), other disabilities such as cerebral palsy, epilepsy, autism, and numerous other neurological impairments are also included. There is wide variation among states in which developmental disabilities are in the scope of the primary state agency or scattered among other agencies. The scope of state responsibility is also complicated by functional definitions of these disabilities, contained in federal and state statutes, which add limitations in major life activities as well as environmental, familial, social, and situational factors to the categorical definitions.

Now that services are less often delivered in state-operated institutions than in thousands of community residential and day settings operated by various public and private agencies, states have great difficulty in controlling other crucial processes that affect their

STATEWIDE ADMINISTRATION: CHOOSING AN APPROACH

In the late 1970s and early 1980s, advocates for people with developmental disabilities were successful in getting separate agencies created to administer developmental services in some states. However, the majority of state developmental services programs are submersed within larger administrative agencies. In many states, the developmental disabilities bureau, office, or division is linked to a mental health unit, and occasionally units dealing with aging, substance abuse, children, and people with other disabilities. These administrative units are embedded in various Departments of Mental Health/Mental Retardation, Health, and Social and Human Services, and often at the second or third levels within the organizational hierarchy. Moreover, various administrative restructurings in the 1990s, under the rubric of reinvention and cost cutting, were universally in the direction of consolidation.

Despite the large numbers of people served in developmental services programs and the relatively substantial costs of these services, in most states, developmental disabilities does not have the cabinet status of programs serving many fewer people and having less substantial operational and fiscal consequence.

Although much of the attention of developmental services advocates and consumers has been on the bureaucratic location of the developmental disability agency, the location of responsibility for Medicaid rate setting and administration has been a less-noticed but important feature in recent reorganizations. In several states, the primary developmental disabilities agency operates the state's large institutions and publicly funded community services, but oversight and funding of private ICFs/MR are the responsibility of separate health financing agencies. The separation of administration, state and Medicaid funding, and rate setting complicates the administration of developmental services in numerous states.

Underlying these diverse approaches to statewide administration of developmental services is the debate about which services framework should guide a state's approach to developmental services.^[5,6]

Supported Living

Concern about the large and growing costs of Medicaid for people with developmental disabilities, as well as the pressures of reinvention, devolution, cost savings, and consolidations, were important forces largely from outside the field of developmental disabilities that resulted in changes in states' administration of developmental services. These external forces were made more potent because they were consistent with demands for change from within the field.

As policy makers and funders grew concerned about the rapidly rising costs of Medicaid for developmental services, advocates in the field pointed out that, although Medicaid was funding more group homes and community-based services, these were largely professionalized, medically oriented programs. Demands for less clinical and more personal supports, direct supports to consumers and families, and more self-direction were central in the approach that became known as supported living or self-determination. Dovetailing with policy makers and funders desires for cost constraints, more funding was shifted from the Medicaid ICF/MR program to the Medicaid HCBS waivers. These waivers were used to fund independent case managers, job coaches, personal care attendants, home modifications, cash subsidies, rent and housing subsidies, and other direct supports to individuals and their natural care givers.

Managed Care

At the same time supported living was being proposed as the new paradigm, managed care has also been preferred as a comprehensive solution for state administration of developmental services. Although advocates saw the capitation mechanisms of managed care as a potential vehicle for reforming the service system, state executives and legislators saw managed care as a strategy for Medicaid reform, cutting the size and growth of costs in an area that had grown disproportionately expensive to the size of the clientele.

Long-Term Care

Long-term care is not a prominent reform theme in this field, but despite the closure and downsizing of large state-operated institutions since the 1970s, large congregate settings are still a major locus of service for people with developmental disabilities. In 1996, there were 59,726 individuals residing in large state-operated institutions, and 79,441 people with developmental disabilities were living in other institutions—38,438 in nursing homes, and 41,003 in private and other large institutions.^[2]

Forensic Services

Throughout the era of the shift from large state institutions to community programs, proponents of continued use of public and private long-term care facilities were largely parents and public employees in those large facilities who raised issues of safety, the availability of medical care, and job security.^[7] In the mid-1990s, the issue of safety reemerged from the

perspective of the community. Megan's Law in New Jersey and the 1997 Supreme Court ruling in *Henricks v. Kansas* that upheld the Kansas Sexually Violent Predator Act, which allowed predatory sex offenders to be paroled from jail to mental hospitals or kept in mental hospitals, refocused attention on individuals who had "challenging behaviors." States have consequently increased the size and built new "secure units" within their developmental services programs, and this enhanced forensic responsibility had become an important feature of states' administration of developmental services.

Paradigms or Boutiques

Medicaid funding through large and small ICFs/MR has imposed an overarching hybrid medical-long-term care framework for developmental services since the mid-1970s. The HCBS waiver provides states the alternative of funding less medicalized services outside the confines of the ICF model, and many advocates for a supported living approach see the waiver as a vehicle for what is termed a new paradigm. However, states are more likely to face the challenge of managing various frameworks for developmental services that arise from different policy choices, as well as important distinctions among the characteristics and needs of people with developmental disabilities.

MANAGING A COMPLEX ARRAY OF PUBLIC AND PRIVATE SERVICES

The state and federal governments are the source of the overwhelming proportion of the costs of developmental services. In 37 of the 51 state (and District of Columbia) jurisdictions, local governments bear none of the direct costs of these services. Local governments in the handful of states with large fiscal contributions play important roles in decisions about funding, access to services, and operation of community developmental services. However, county governments that make no, or negligible, contributions still play important roles in many states, often passing state and federal funding through contracts and making key decisions about which agencies get funding, what services are funded, and who receives access to services. This results in wide variations within many states in the availability and accessibility of developmental services.

In addition to local governments, substate specialized developmental services agencies play important roles in several states. In some states, state regional offices play important roles in decisions about which agencies get funded, what services are funded, and who receives access to services. In other states, local

or regional organizations are non-profit or hybrid public-private organizations, where state and local governments share some governance power with formal parent, advocacy group, and consumer representation. These substate agencies may provide other services or contract with local service provider agencies. They may also act as a single point of entry into the service system, which is a key element of local control.

Administering and Coordinating Lifelong and Changing Services

Because developmental disabilities become manifest at birth or infancy, providing, paying for, or ensuring health and medical services are issues for state administration at the early stages in the life. In addition to health and medical services, until the individual reaches school age, states usually fund, certify, oversee, and manage various early intervention, preschool, and specialized developmental services delivered by various state and local government, school district, and private providers. The financing of early childhood services is a patchwork of Medicaid, private insurance, and state and local government funding, depending on and individual's age and need for services and other eligibility criteria, which change as the individual ages and/or requires different types of services.

Local school districts are mandated by the federal statute, the Individuals with Disabilities Education Act, to provide a free and appropriate public education. Although school districts assume the primary responsibility until the individual "ages out," typically at age 22, the underfunded costs of educational and support services borne by local school districts are a perennial state budget issue. State administration and coordination of support and ancillary service providers of services to school-age individuals is an additional challenge to state education and developmental disabilities agencies.

For individuals younger than age 22, the primary state developmental services agency usually plays a secondary role—certifying early intervention providers, sometimes providing funding, delivering or funding family support services, and playing a role in coordinating services for children younger than age 21. However, when an individual with a developmental disability "ages out" of school, another distinct panoply of eligibility criteria, funding mechanisms, provider organizations, and services comes into play. The mandates of the Individuals with Disabilities Education Act cease; waiting lists are encountered; funding mechanisms change; and services fall within a new state administrative framework: the various state-level departments, divisions, offices, and programs. From the perspective of the state developmental services

agency, the individual who seeks access to adult services is likely to have a 20 or more year service history. State developmental services agencies must deal with parents with experience with mandated educational services, eligibility based on age, and other entitlements and expectations that may not be part of a state's adult developmental services program.

Providing, Funding, and Overseeing Developmental Services

In every state, there is some version of the following organizational landscape: state agency-operated large institutions; state or local government agency-operated community services; and private non-profit and for-profit agencies operating large institutions, group homes, community day programs, and family and individual support programs. The mix varies widely from state to state, represents a combination of strategic or incremental policy choices and private practices, and is undergoing substantial changes in some states. With the privatization and devolution of state operated services, budgeting, rate setting, contract administration, quality assurance, and outcome measurement for private agency contracting represent substantial administrative changes from the mechanisms and procedures of direct government operation.^[8,9]

Most of the attention to these problems has been on the non-profit sector, where the administrative problems of contracting with a fragile non-profit sector and the entrepreneurial growth of some non-profit agencies have been the focus.^[8,10] A more recent phenomenon in the developmental disabilities field has been the growth and entry of large for-profit corporations. Some of these corporations operate hundreds of group homes and day programs in several states and specialize in developmental services. The growth of managed care has brought numerous generic managed care organizations into the field, and although the overall penetration remains low, developmental disability advocacy and provider organizations see these corporations as having the potential to effect substantial changes in the organizational landscape of developmental services. From the standpoint of a free state administration, the challenges of managing networks of small, often fragile provider agencies are obviously different from dealing with large, multistate, multiprogram non-profit organizations and for-profit corporations.

The experience of the past 30 years has been one of managing highly regulated networks: certifying providers, shoring up fiscally fragile agencies (large and small), attempting to ensure some equity in availability of services within and among locales, and managing access of individuals into provider organizations.

The simultaneous growth of small supported living agencies, access of consumers to private market and generic sources of support, large multistate developmental services corporations, and managed care organizations presents an exponential increase in complexity for state administration in budgeting, rate setting, contract administration, quality assurance, constituency relations, and policy making.

COURTS AND STATE ADMINISTRATION OF DEVELOPMENTAL SERVICES

The final major issue in state administration of developmental services is the renewed role of federal courts in this arena. Suits brought by advocates in federal courts during the 1970s and 1980s played an important role in the closure and downsizing of large state-operated institutions. The decision in *Sullivan v. Zebley* was critical to an expansion of Supplemental Security Income eligibility for children and had a significant impact on increasing the numbers of individuals states were required to serve.

After a decade or more of remaining on the sidelines, federal courts reentered the arena on the so-called "waiting list" issue. First in Florida, and later in Massachusetts, federal courts have agreed with plaintiffs' claims that states were violating their rights by failing to meet their obligations under federal statutes to furnish services covered under its Medicaid plan "with reasonable promptness to all eligible individuals" (*Doe v. Chiles*, 42 USC 1396(a)(8)). The effect on administration of developmental services is that states may no longer limit the entitlement for Medicaid-funded services (representing 35% to 60% of total state expenditures) by claiming a lack of funding for adequate programs and services. By the early 2000s, constructing a waiting list plan sufficient to keep the federal courts at bay became a major issue for virtually every state developmental services administration.

State and Local Public Pension Fund Management

Jun Peng

*School of Public Administration and Public Policy, University of Arizona,
Tucson, Arizona, U.S.A.*

INTRODUCTION

Public pension funds constitute a very important part of state and local government finance. They are important for at least two reasons. First, they hold an enormous amount of assets. According to the Census Bureau's annual survey of state and local finance, the total value of assets in public pension funds amounted to \$2.2 trillion in fiscal year 2002, covering 17 million members in the public sector.^a Thus the mismanagement of pension assets will affect the well-being of 17 million current and retired public sector employees. Second, pension funds are closely linked with the government operating budgets from which the pension contributions come. Through this connection, mismanagement of pension funds will therefore also affect other aspects of government finance such as the provision of public service. It is therefore critical to have a good understanding of pension management. This article serves to explain the most fundamental aspects of pension management, especially with regard to the measurement of pension fund liability and the main elements of prudent pension management in the public sector.

DEFINED BENEFIT AND DEFINED CONTRIBUTION

The first important thing to understand is the two very different types of retirement programs provided by the government: defined benefit (DB) and defined contribution (DC). In DB plans, government employers guarantee a certain level of retirement benefits to employees when they retire. In DC plans, employers guarantee a certain level of contribution, usually as a percentage of salary, to employees' individual retirement funds while they are working, but are not responsible for their retirement benefits when they retire. Instead, the employees have to be responsible for own future retirement benefits. Although DC has attracted more attention in recent years as many states

set up new DC plans and employees can switch to DC plans from DB plans,^[1] DB remains the predominant plan type among state and local government workers. In 1998, there were 12.98 million members in state and local public DB plans,^[2] accounting for 80% of the 16.15 million members in all state and local public pension plans in that year.^[3] Therefore the remaining of this article is only concerned with management issues related to DB plans.

The next important thing to understand is the funding methods for DB programs. There are two basic ways of funding DB programs: pay-as-you-go (PAYGO) and advance funding. PAYGO means that the current year's benefits to retirees are paid out of current year's contribution from employers and employees. Advance funding means that while an employee is still working, the employer and/or the employee will set aside a certain amount of money every year so that by the time the employee retires, a sufficient amount of funds has been accumulated to pay for all his future benefits. It is quite obvious that at the federal level, social security, although not entirely a retirement program, is funded on a PAYGO basis, as current workers' social security taxes are used to pay for current retirees' social security benefits. The looming social security crisis comes largely as a result of not having enough taxes coming in to pay the retirement benefits in the future. Unlike the federal social security program, state and local pension programs are funded using the advance funding method. With advance funding, the key issue is knowing the amount of funds that needs to be accumulated by the time the employee retires and the amount of funds that needs to be set aside every year so that the required amount will be accumulated by the time he retires. Understanding this issue is the key to understanding almost all other important aspects of public pension management.

ACTUARIAL EVALUATION METHOD

First, how do we know how much to set aside by the time the employee retires? To understand this, we first need to know how the future retirement benefits are calculated. An employee's future benefit is based on a formula like this: final salary $\times$ years of

^aThe data can be found at the Census Bureau's website <http://www.census.gov/govs/www/retire02.html>.

Table 1 Iowa public employees' retirement system funding status

Fiscal year	Actuarial value of assets (AVA)	Actuarial accrued liability (AAL)	Percentage funded	Unfunded actuarial accrued liability (UAAL)
2003	16,120,476,011	17,987,374,960	89.62%	(\$1,866,898,949)

service $\times$ multiplying factor. An example is if an employee's final salary is \$50,000 and has worked for the government for 30 years. Suppose the multiplying factor is 2% of an employee's final salary for each year of service, then his annual pension will be \$30,000. Second, pension sponsor needs to make an assumption about how long he will receive the pension after he retires. Last, because of the time value of money, a pension paid 30 years after he retires is worth a lot less than a pension of the same amount paid the year he retires. The pension sponsor needs to discount and find the present value of all future pension benefits by the time he retires.^b It is this present value of all future pension benefits that becomes the amount to be accumulated.

Second, how should this present value of all future benefits be funded over the working life of the employee? The key principle here is that the funding of benefits should be related to the period in which benefits are earned. There are several actuarial cost methods to distribute the cost over time, such as entry age normal, projected unit credit, and aggregate cost. Of these, the most commonly used is the entry age normal method. Under this method, the present value of future benefits is allocated as a level percentage of the individual's projected compensation between the time he starts working and the time he retires. The purpose of such a method is to spread evenly over time the cost of funding. The part of this total cost allocated to the year in which the service is provided is considered that year's normal cost, and the part allocated to future years is considered future normal cost. Once a person has already worked for sometime, then he has earned (or accrued) some benefits which the pension plan has to pay. To evaluate whether the pension for an employee has been funded sufficiently at any time before he retires, the present value of all his future benefits at the time of evaluation is divided into two parts: the present value of benefits already earned (or accrued) as a result of the service provided prior to the date of evaluation, which is now the pension plan's liability, and the present value of benefits yet to be earned. The first part should be covered by the assets already held in the pension plan and the second part should be covered by the present value of all future normal cost.

^bThe discount rate used for such discounting will be discussed later in this section.

Now we can use these basic concepts to understand the funding status of a pension plan at any particular time. Data in Table 1 were taken from Iowa's Comprehensive Annual Financial Report for FY2003. Such format is a standard way of reporting funding status of a pension plan.

In this table, actuarial accrued liability (AAL) is the difference, as of the actuarial evaluation date, between the present value of all future pension benefits and the present value of all future normal costs. AAL can roughly be interpreted as the present value of future benefits already accrued and thus is the liability of the plan. Then AAL is compared to the actuarial value of asset (AVA) on hand. The difference between the two is called unfunded actuarial accrued liability (UAAL). Dividing AVA by AAL, we also get a funding ratio of the plan. If AVA is greater than AAL, then the plan is overfunded. UAAL will be negative and the funding ratio will be greater than 100%. If AVA is less than AAL, then the plan is underfunded. UAAL will be positive, and the funding ratio will be less than 100%. In Iowa's case, because AVA is less than AAL, the plan is underfunded. It has a UAAL of US\$1.87 billion and a funding ratio of 90%.

To fully understand the actuarial evaluation method, two more elements need to be discussed: actuarial valuation of asset and assumptions underlying the valuation of liabilities.

The actuarial value of asset is different from the actual value of the asset in a pension fund. Inasmuch as most of the assets in a pension funded are invested in the stocks and fixed-income securities, the value of the assets can fluctuate tremendously from year to year because of the fluctuation in the financial market. Simply comparing AAL to the actual value of the asset will result in big swing in the funding status. To reduce such volatility, a smoothing technique is adopted in valuing the asset. Such technique involves calculating a 4- to 5-year moving average of investment return when valuing the asset. For example, if using a 4-year moving average, then only 25% of the investment gains or losses each year over the past 4 years will be recognized in valuing the assets for the current evaluation year. The rationale is to smooth out the ups and downs in the financial market, leading to a more stable investment return over a 4- to 5-year period. Therefore in some years, the actuarial value can be higher than the actual value of asset, whereas in other years, it can be lower than the actual value of the asset.

It can already be inferred to some extent from the previous discussion that the calculation of future benefits involves a lot of assumptions. These assumptions fall into two categories, economic and demographic. Economic assumptions include rate of investment return, inflation rate, and salary growth. Demographic assumptions include mortality rate and disability rate, among others.^c Of all these assumptions, the assumption on the rate of investment return is the most important one by far. The rate of return determines how fast the asset is projected to grow in the future. It is also the rate used to discount the future benefits and future normal costs to the present value. Why should the rate of return be used as a discount rate for calculating the present value of future benefits? That is because allowing the present asset to grow at a certain rate to reach an amount in the future to pay the pension benefits is the same as discounting that future pension payment to the present value using the same rate in order to compare with the value of the asset in the pension today. This assumption is important because different rates can lead to very different present value of future pension liabilities. For the same amount of future pension liabilities, an assumption of a higher rate of return (or discount rate in this case) will lead to a smaller present value of pension liabilities. Because it is the present value, rather than the future value, of pension liabilities that matters in evaluating the funding status of a pension plan, a smaller present value of pension liabilities would leave the plan in a better funding status than otherwise. When evaluating the soundness of a pension plan, one of the key factors a rating agency will look at is the assumed rate of investment return.

Other assumptions are also important in determining the value of future benefits. For example, salary growth projection will determine what a person's final salary will be. Inflation projection will determine what cost of living adjustment for current retirees will be. Mortality rate will determine how long a retiree will receive pension benefits.

PENSION FUND MANAGEMENT

With the basic understanding of the actuarial valuation of pension fund, we can proceed to look at some broader issues concerning pension fund management. The central theme in pension fund management is to make sure that it is sufficiently funded at any time and if UAAL emerges, a plan should be in place to shrink it and eventually eliminate it. There are two basic ways of paying off UAAL: amortization and pension obligation bonds (POBs).

The first and also the most commonly used method, amortization, is the same as paying off a mortgage or car loan. Inasmuch as UAAL is a financial liability of the government, it is no different from other types of debt or loans. To spread out the burden of paying off UAAL, actuarial requirement typically demands that UAAL be amortized over a 20- to 30-year period. Just like an individual who has to pay interest on the mortgage loan he takes out, the government also has to pay interest on UAAL when paying it off, with the interest rate being the assumed rate of return. The reason a government has to pay interest to the pension plan on its UAAL is because UAAL is the present value of future benefits not covered by current assets. Any portion of UAAL that is not paid off will therefore grow at its discount rate, which is the rate of return. Therefore the UAAL next year will be equal to the unpaid portion of UAAL this year plus the growth on the unpaid portion. This growth is the interest on UAAL. UAAL can also be thought of as the amount of asset that should have been in the pension plan at present. Had this amount been in the plan and invested, it would have grown at the assumed rate of return and earned investment income. Therefore the government has to return not only the asset (the amount equal to UAAL) to the pension plan but also the lost investment income (the amount equal to the interest on UAAL).

The second and less common way is to issue POBs to pay off the UAAL at once and then the government will pay debt service on POBs. POBs does not impose a new debt burden on the government, because it essentially turns a debt owed to the pension plan into a debt owed to the investors in POBs. There is only one factor that should determine whether amortization or POBs should be used: interest rate. With amortization, the government has to pay interest at the rate of return to the pension plans. If the government can issue POBs at a rate below the assumed rate of return, then the issuance of POBs results in interest cost savings to the government. While the assumed rate of return is usually based on historical return and does not change frequently, the interest rate on POBs is determined by the prevailing market interest rate and the issuer's credit rating. With the very low interest rate environment in recent years, the rate on POBs has also fallen considerably, resulting in opportunities for issuing POBs. While POBs can lead to interest cost savings, it is not without any risk. For example, if the proceeds of the POBs are invested and do not earn the assumed rate of return, then a new pension liability is created.^d

^cFor a more detailed discussion of assumptions, please see Ref.^[4]

^dFor a more detailed discussion of the pros and cons of POBs, please see Ref.^[5]

While understanding how to pay off UAAL is important, it is more important to understand why it occurs in the first place. Understanding the various factors for causing UAAL will shed light on how to prudently manage public pension fund. As discussed in the "Actuarial Evaluation Method," the calculation of UAAL consists of three factors: government contribution, asset in the pension plan, and the calculation of future pension benefits. The reason for underfunding then has to be found among these three factors.

Annual pension contribution consists of one or two parts. The first part is the normal cost, which is the portion of the future benefits assigned to the year in which it is earned. This should apply to every government with a pension plan. The second part consists of amortization of UAAL if a government has one. If normal cost is not fully contributed every year, then it will result in underfunding. If the amortization portion of the contribution is not fully met, then underfunding will worsen rather than improve. Therefore making the required contribution is one key element in making sure the pension fund is properly funded; if it is already underfunded, then such underfunding shrinks over time.

Once the contribution is made, it becomes the asset of the pension plan and will be invested. Investment management thus becomes the second element in ensuring a pension is properly funded. In their book on investment management process, Trone et al.^[6] list five key steps in a prudently managed investment process. These five steps are analyzing the current position, designing the optimal portfolio, developing an investment policy statement, implementing the investment strategy, and monitoring the performance of your investment portfolio. While all of these are important steps in making sure the investment is properly managed, what is of particular relevance to this article is designing an optimal portfolio. As pension fund investment has to meet the required rate of return, an optimal portfolio means designing an asset allocation

strategy that will allow the pension plans to achieve this rate of return with minimum risk (or least variation from this expected return). Asset allocation refers to dividing pension assets among a variety of investment categories such as equity, bonds, and real estate. For prudent pension management, such asset allocation strategy should be neither very conservative nor very aggressive. A very conservative strategy, such as not allocating a sufficient amount for equity, will make it very difficult for the pension plans to achieve the required rate of return, resulting in funding shortage. A more aggressive strategy, which tends to invest a very large portion in the stock market, may also lead to substantial decrease in pension funding level during a financial market slump.

On the liability side of the equation, the calculation of future pension benefits can change. Such change comes when government officials increase the level of pension benefits, possibly as a result of negotiations with public sector unions. Because pension benefits are not paid right away, it is potentially easier for politicians to promise an increase in pension benefits than an increase in wages, especially when the pension fund is very well funded. Therefore when government officials increase pension benefits, they need to be mindful how that will affect the pension funding status. If an increase in benefits is not matched by an increase in contribution or an increase in investment return, then a funding shortage can occur.

Because of these three factors, a pension plan that is fully funded today does not necessarily mean it will be fully funded tomorrow. Because of the method UAAL is calculated, to maintain its full funding status, the government still needs to contribute the required amount, earns the required rate of return on investment, and should not make changes in benefits without careful analysis of the impact on the pension funding status.

To complete the discussion of public pension funding status, it is useful to see how public pension

Table 2 Public pension funding ratio and asset allocation

	1990	1992	1994	1996	1998	2000	2002
Funding ratio	80.2	82	84.9	88.7	95.2	103.8	96.1
<i>Asset allocation</i>							
Domestic equity	37.8	39.3	40.2	42.0	47.9	45.0	41.1
International equity	2.0	3.7	6.5	10.5	12.0	15.3	13.9
Domestic bonds	44.4	41.4	35.0	34.3	28.6	26.1	33.2
International bonds	0.8	1.8	2.4	2.5	2.0	1.8	1.5
Mortgages and real estate	5.6	6.3	5.4	4.6	4.1	4.8	4.0
Short term	5.8	4.6	4.2	2.9	2.2	2.2	2.2
Other	3.6	2.9	6.3	3.2	3.2	4.8	4.1

funding level has progressed over the years. Every other year since 1990, the Public Pension Coordinating Council (PPCC) has been conducting survey of public pensions. The data on funding level and asset allocation are presented in Table 2.^e

It is obvious from this table that public pension funding has improved substantially since the early 1990s. The funding ratio increased from 80% in 1990 to 104% in 2000, meaning the pension funds overall were overfunded in that year. It is not a mere coincidence that this improvement happened to go hand in hand with an increase in asset allocation for equity, both domestic and international. That allocation increased from under 40% in 1990 to about 60% in the late 1990s. This increase in allocation for equity happened amid one of the greatest stock market booms in history, thus substantially increasing the value of assets in pension funds. It is no wonder that the 6-year stock market slump starting in 2000 also substantially decreased the value of these assets and lead to deterioration in pension funding level in 2002.

LOOKING FORWARD

Looking into the future, public pension funds will assume more prominence in government finance than in the past. As mentioned in the “Introduction,” the annual pension contribution has to come out of the government operating budget. It is therefore in direct competition with other vital public services for the scarce financial resources. Because of the phenomenal investment return in mid to late 1990s, the government could afford to both reduce pension contribution and still maintain a full funding status. The subsequent stock market crash, however, ended such a “holiday” for pension contribution. As can be seen from Table 2, the average pension fund is now underfunded. After years of decreasing pension contributions, many states now are seeing substantial increase in pension contributions, at a time when many states can least afford to do so because of the fiscal difficulty. Because of the underfunding, the government has to pay not only its normal cost but also the amortization of UAAL. The worst has yet to come. Because of the smoothing

technique used in valuing the assets in the pension funds, much of the stock market loss between 2000 and 2002 has yet to be filtered into the valuation of the assets. For example, if using a 4-year smoothing technique, a portion of the loss of 2002 will remain in the valuation until 2005. That means the underfunding situation will continue to deteriorate for several more years before it gets better, and the government pension contribution will continue to increase. To make matters worse, the sustained over 20% investment return in mid to late 1990s in the stock market probably will not come back any time soon and the investment return in the future more likely will only match the historical average return. Therefore, on the one hand, the government tries to make up for the investment loss; on the other hand, it also has to make sure that its future investment will meet the required rate of return. Otherwise, even greater funding gap will occur. With the future investment environment not as favorable as the one in the 1990s, it is all the more important for government to stick to the basic prudent pension management practices as laid out in this article.

State Enterprise Zones

Ryan J. Watson

Washington, District of Columbia, U.S.A.*

INTRODUCTION

President Reagan first introduced Enterprise Zones in the United States in his Urban Jobs and Enterprise Zone Act of 1980. Congressional interest, debate, and legislation concerning EZs continued over the years, but no federal EZ program ever materialized.^[1] But, state officials loved the idea of building political capital by providing unbudgeted financial assistance to underdeveloped communities. By 1995, 2,840 zones had been established in 34 states: “no two states’ enterprise zone programs are alike . . . unlike many other common state incentive programs that have been patterned after prominent federal income tax programs.”^[2] Tax incentives provided the most attractive incentives in recruiting businesses (see [Table 1](#)).

HOW DO STATES JUSTIFY TAX INCENTIVES?

EZ tax incentives have many advocates.^[3] Public officials fear that their state or community will lose business to areas with more favorable business environments. Decision-makers want to rescue failing firms and shield businesses from competition.^[4–6] Drawing in businesses from other areas or facilitating the start up of new firms can boost the economic well-being of a community.^[6–9] Unsure about the intentions of private businesses, states offer tax incentives to hedge their bets.^[5,6] Since most states and communities already offer tax incentives, policymakers simply follow the herd and offer similar incentives.^[10]

Localities frequently perceive incentives as free money. The federal government underwrites some tax incentives and state taxpayers pay for state tax incentive costs, so localities receive free money.^[11] Pervasive government intervention in markets means that tax incentives can go unnoticed,^[12] especially since EZ incentives are generally not part of the state budget process. Tax incentives are viewed as a net benefit since the initial loss of tax revenue is eventually recaptured directly or indirectly-through taxes and growth. Market failures in state economies can be corrected

by judiciously using incentives.^[13,14] But in reality, politicians mostly use EZ programs to appease constituencies or advocates for distressed places.

WHAT IS THE STATUS OF EZ PROGRAM EVALUATION?

States rarely perform evaluations to determine the effectiveness of EZ programs or to answer economic development questions.^[15–17] A National Association of State Development Agencies survey of states concluded that states had not conducted rigorous cost-benefit evaluations of the incentives they offered. Likewise, the Council of State Governments’ annual incentive survey found that only a few states used a formal cost-benefit model to gauge the impacts of tax and financial incentives.^[18] The National Conference of State Legislators concluded: “Few states know the exact amount they spend on economic development initiatives.”^[19] A survey conducted by Lohman, et al.^[2] found that while zone administrators believed that EZ incentives increased jobs and investment in zones, few states could offer adequate statistics to measure the effectiveness of these programs. The disregard for cost-benefit analyses is a significant factor in making EZ programs ineffective.

In his literature review, James^[20] concluded that there has been no thoroughly acceptable evaluation of the impacts and cost-effectiveness of an EZ program (see also Ref.^[21]). Nonetheless, existing studies offer important insights.

ARE EZ TAX INCENTIVES GOOD ECONOMICS?

EZs are largely unassailable in a political sense. Republicans favor them because they promote economic development using market-based incentives rather than entitlement programs, and Democrats support EZs since they represent a major source of social welfare funding for disadvantaged communities. EZ tax incentives are also good politics because policymakers

Table 1 Examples of state EZ incentives

- State income tax deductions, credits, or exemptions
- Local income tax reductions, credits, or exemptions
- Infrastructure improvement
- Property tax breaks
- Unemployment tax credits
- Sales tax refunds, credits, or exemptions
- Regulatory relief
- Job training assistance and subsidies
- Deduction for net interest income coming from loans to qualified zone firms
- Credit for wages paid to “disadvantaged individuals”
- Low interest loans
- Day care tax credits
- Business development assistance
- Contributions to enterprise zone associations
- Permission to carry forward 100 percent net operating loss for many years
- Reimbursement of insurance costs
- Expensing all or a portion of qualified property

Sources: Refs.^[2,23,24]

can redirect resources to stimulate economic growth and development in the poorest regions of their states, which theoretically increases long-term state tax revenues.

All political factions use tax codes to benefit certain projects or sectors. Businesses are strong advocates of EZ tax incentives, and the taxpayers who bear the financial burden of these incentives are largely unaware of their existence. EZ failure can be blamed on business cycles, market forces, dysfunctional business behavior, or in extreme cases on poor people in distressed places (e.g., high crime). When the economy is booming, policymakers can easily claim political dividends by saying that EZs contributed to the positive economic climate. These claims may be untrue, untested, or exaggerated, but citizens have no reliable way of evaluating these statements.

Setting aside politics, it is worth considering whether EZs are good economics. Economists offer various criteria that can justify public investment in EZs. In practice, the criteria outlined in the tax literature appear to be frequently ignored. Courant^[22] suggests that if zone policies address market failures such as the inefficient utilization of resources or overly localized economies, zone incentives can increase economic efficiency. If investment is relocated from local labor markets with low unemployment to ones with higher unemployment, incentives may generate efficiency gains as underutilized resources are mobilized. Efficiency gains may also result if reductions in

unemployment produce positive externalities such as reductions in welfare dependence or crime. Bartik^[14] argues that net capital investment may be somewhat irrelevant, because redistribution, even within a state, may be an end in itself. Investment, through tax incentives, may allow individuals to build job skills and experience that enhance their long run employability.

There is a large body of research that says EZs are not effective economics. Peters and Fisher^[23] examined 75 EZs in 13 states by using a “hypothetical firm” computer simulation. They applied tax incentives to financial statements that they generated for hypothetical firms. Peters and Fisher came to largely negative conclusions about how well EZs work, as well as finding that the goals and policies of EZ programs are often confusing. Knowing that housing value growth rates are a quantifiable measure of EZ programs’ effectiveness, Engberg and Greenbaum^[24] conclude that EZs do not usually increase the growth rate in property values. In fact, zones that had high vacancy rates before being designated an EZ actually experienced a decline in the property value growth rate. Netzer^[25] concludes that economic development tax incentives including those in EZs are, for the most part, neither good nor bad from the standpoint of economic efficiency. With imperfections in economies due to government interference at all levels (see also Ref.^[12]), offering incentives does not parallel the efficiency operations of private competitive markets.

Research generally fails to measure how much market failures justify tax incentives. Skeptics believe that most tax incentives are poor economics.^[26] Advocates believe that tax incentives work or do little harm, and that diverting economic development funding to assess them is a waste of money.^[12] The majority of the research supports the skeptical view.

DO EZs STIMULATE GROWTH?

Some studies attribute economic growth to EZs, but more studies convincingly find negative or inconclusive results (e.g., Ref.^[1]). Numerous studies of the same zones come to opposite conclusions, while some researchers reverse their positive conclusions in follow-up studies. Many correlations between taxes and economic growth are methodological artifacts (see Refs.^[26]).

Multi-State Studies

Several researchers have undertaken multi-state EZ studies, the most extensive and rigorous among them are Peters and Fisher^[27] and Greenbaum and Engberg.^[28] Peters and Fisher studied manufacturing

employment in 75 zones found in 13 states, comparing zone incentives and non-zone incentives to businesses. They found that during the 1990s, non-zone incentives grew in importance relative to EZ incentives, effectively lessening the potential impacts of zones. They concluded "EZ incentives tend to favor capital-intensive over labor-intensive industries; usually cause losses to public coffers and have very little impact on new investment; and do little to improve the job prospects of residents in the zones."

Greenbaum and Engberg^[28] studied zones in California, Florida, New Jersey, New York, Pennsylvania and Virginia. Results showed that "the zone incentives do not significantly improve housing market, income, or employment outcomes either in the zones themselves or in adjacent neighborhoods."^[28] They hypothesize that the lack of impact may be attributable to 1) zone programs crowding out other beneficial policies; 2) zone incentives may subsidize businesses that lack long-term viability; or 3) zone designation may carry a stigma.

Indiana Zones

Papke^[29] initially found mostly positive impacts for Indiana EZs. Indiana EZs permanently increased inventory values to 8%, or \$3.2 million, more than would have been the case without the zone. Papke^[29] also found that unemployment claims declined by 19%, or 1,500 people, for the local labor market following zone designation. However, value of machinery and equipment declined by 13%, or \$5 million.

Papke^[30] subsequently reversed her positive conclusions, saying that EZs lost an average of about 2,300 people, or 674 households. Per capita income fell 2%. Zone unemployment only dropped from 9.3% to 8%. The percentage of people working in the zone as a place of residence rose only 4%. Firms created 2,897 new jobs in Indiana zones in 1988, with 15% going to EZ residents. Zone residents earned about half as much as non-resident EZ employees. Annual cost of an Indiana EZ job was \$4,564, or \$31,113 per zone resident. Zones lost more population and experienced a decline in per capita income compared to income growth in non-zones, while unemployment only fell slightly in zones, and fewer zone residents actually worked in zones.

New Jersey Zones

Urbanomics conducted a cost-benefit study of businesses in 11 New Jersey EZs (see also Ref.^[31]). Analysts defined benefits as jobs, payroll and production, both directly and through multipliers. The EZ program cost taxpayers \$51.6 million, but induced \$106.5 million in

subsequent tax revenues, totaling \$267.4 million with multipliers. The direct tax benefit-to-cost ratio was 2.2:1, and the total tax benefit-to-cost ratio was 5.2:1. Cities that had grown slowly before designation grew faster than comparison cities once the zone was in place.

Boarnet and Bogart,^[32] using an econometric model with a panel study design, tested Rubin and Trawinski's conclusions^[31] by studying 28 municipalities eligible for zone designation and 7 municipalities that actually became EZs in 1984. Boarnet and Bogart "found no evidence that the urban enterprise zone program in New Jersey had a positive effect on total municipal employment, on sectoral employment or on municipal property values."^[32]

Illinois Zones

Sridhar^[33] studied 49 Illinois zones. Sridhar found that economic development incentives, on average, yielded net benefits 10 times higher than tax abatement costs. For new jobs created, earnings were highest in low-unemployment zones and lowest in high-unemployment zones. But when earnings were made net of reservation wages, which are the wages necessary to induce people into the labor force, net benefits and benefits per job were greatest in high-unemployment zones. While net benefits and benefits for each job relocated were highest in high-unemployment areas, they were negative in low-unemployment areas. Therefore, positive net social benefits would exist if all jobs were redistributed from average-unemployment areas to EZs.

McDonald^[34] argued that Sridhar's work was invalid because it assumed that EZ programs were responsible for all jobs created in a zone. Lambert and Coomes^[35] studied one Louisville EZ where more than \$560 million in federal and state funding went towards the expansion of Louisville's airport, causing United Parcel Service (UPS) to increase its operations within the EZ. When evaluating Louisville's EZ, Lambert and Coomes write, "Most of the EZ benefits claimed by the proponents are linked to the airport expansion. UPS and other airport-related firms did take advantage of EZ tax advantages; however, it would be far-fetched to claim that the EZ program caused the local economic benefits."^[35]

California Zones

Dowall^[36] analyzed 13 California zones. Shift-share analysis attributed virtually all employment growth from 1986 to 1990 in zones to countywide growth and industrial mix. Zones actually retarded employment by 5,578 jobs.

Maryland Zones

The General Accounting Office (GAO)^[37] studied three Maryland EZs from 1980 to 1987, finding no effect on employment or welfare dependence of workers. Job creation in the zones did not affect costs incurred in subsidizing firms. GAO reviewed comparative case studies, state program evaluations, and broad reviews of program results, concluding that studies either had flaws or failed to focus on program-related changes in employment. Flaws included: 1) reliance on data of unknown or dubious quality such as surveys of zone administrators; 2) measurement of program effects too soon after zone designation; and 3) failure to use an adequate baseline for attributing observed effects to possible influences.

Ohio Zones

Hill^[38] studied Ohio's Amended Substitute Senate Bill 19, which reformed the state's EZ program. Hill examined numerous publications and key informant interviews to assess Ohio's EZ program. He concluded that the program is an ad hoc business tax reduction, not true tax reform. The program puts most distressed areas of the state at a competitive disadvantage. Even though the program intends to respond to interstate competition, its major impact was to stimulate intra-state tax competition. The program's exaggerated benefits did not result in net new job formation.

Rural Zones

Few studies examine rural EZ effectiveness, and findings conflict (see Refs.^[39–41]). Louisiana zones were declared ineffective.^[42] Robinson and Reeder^[40] conducted the best research on rural EZs. They reanalyzed the rural zone data in the 1996 HUD survey of zone administrators. Rural zones created or saved 2 jobs per 100-zone residents as compared with 3 jobs per 100 residents in metro zones. Only one of seven zones reported saving any jobs. Rural zone development came almost entirely from expansions within the zone. Most were manufacturing companies. Three-fifths of jobs created went to zone residents and one-half went to unemployed people. Weaknesses in the Robinson and Reeder^[40] study include reliance on zone administrator surveys and an inability to determine whether jobs would have been created in the absence of zone incentives. Using the number of jobs saved to measure success is also problematic.

Urban areas often dominate funding for EZ programs. In Florida, 83% of EZ tax incentives went to just three urban zones, while less than one percent of the EZ funding went to the state's twenty rural

EZs.^[43] Rural and small-town EZs also experience difficulty in the implementation and administration of EZ incentives. While Florida's Miami-Dade County spent approximately \$325,000 for the administration of its EZ program in the 1998-1999 fiscal year, many coastal communities within the state put less than \$1,500 each towards EZ management in the same year.^[43]

Federal Studies

In the 101st Congress, legislators proposed six EZ bills. Bills provided labor subsidies to reduce wage costs by almost 14% if half of total wages were devoted to economically disadvantaged workers. Some firms might increase EZ investment between 8.5% and 20%, employment between 6.5% to 14%, and output between 7.5% and 15%. But tax-induced increases in investment, employment, and output in EZs would largely be offset by declines elsewhere.^[44] EZ investments could earn up to 39% lower pre-tax rates of return than are available from alternative investments, representing a reduction in national income. HUD researchers concluded that job creation could not be attributed to EZs; other factors were responsible.^[1]

ARE EZ TAX INCENTIVES WASTED?

Literature is divided on whether investment would have occurred in the absence of an EZ, although the best research suggests that it would have. This literature relies heavily on surveys of firms and administrators, as well as administrative data.

Surveys of Firms and Zone Administrators

Dowall's^[36] study of California EZs showed one-half of eligible zone firms did not use incentives. Another fourth tried to access incentives but were unable to do so. 67% of businesses using zone programs stated that traditional factors such as markets, transportation, and worker availability influenced their location or expansion decisions, not EZ incentives. Importantly, many businesses did not discover tax incentives until after making their decisions. Elder and Cohen^[45] had identical results in their Illinois zone study. 77% of Louisville's EZ firms that used the most expensive and common EZ benefits made their decisions based on factors other than EZ incentives.^[35]

GAO's Maryland study^[37] used interviews with several hundred employers to explore the importance of locational factors. GAO presaged Dowall's^[37] findings above. At least 60% rated market access, community characteristics, site characteristics and government cooperation as important in their location decision.

Transportation, real estate, financial health of region and quality of life were rated as important by at least 50% of employers. Financial incentives were important to only 14%.

Rubin and Trawinski's^[31] study of New Jersey zones, by contrast, revealed greater impact. When companies were asked about location decisions, 32% reported that EZ benefits were the only or primary reason for their decision to expand or locate within zones, 38% suggested that EZ benefits provided a secondary reason to consider the zones, and 30% felt that EZ benefits had no impact.

HUD's interviews with zone administrators found that property and corporate income taxes were ranked first in importance by two-fifths of respondents. This contrasts with GAO's conclusions (as reported in Ref.^[1]).

Firms differ in their consideration of EZ incentives when making decisions. Firms may misrepresent their motivations for using incentives: some may not need them, but still justify why they used them; some may not need them, but want to show support for zone administrators or the economic development department; and some may truly need them. Skeptics are not convinced that researchers have sorted out these motivations.^[46]

Administrative Record Studies

Dowall's^[36] report on the results of the California State Franchise Tax Board tax credit study concluded that incentives are not important. Board records showed that 1,719 jobs were created by granting tax credits to zone businesses, a figure representing only 5% of the jobs reportedly created in zones by zone administrators. EZ employment from tax credits contributed only 6% of total net increase in zone employment between 1986 and 1990. Therefore, EZ administrators may exaggerate job creation and retention in order to bolster program support. California EZ businesses claimed \$10.6 million in tax credits between 1986 and 1990, while the total net taxable income of zone firms was \$2.7 billion: tax credits address a small part of business costs.

DO EZS EXACERBATE TAX WARS AMONG STATES?

Disadvantaged communities offer incentives to attract firms to EZs, but these have a limited effect on interstate competition. Few firms relocate. Effective tax rates overall created competition mostly within rather than across states.^[47] The average effective tax rate in cities outside zones was 9.1% as compared to 7.3%

inside zones. Average state and local tax burden on new investment, then, was only 19% lower. Considerable variation occurred across cities. Outside zones in low-tax cities, the effective tax rate was 5.6% and 14.7% in high-tax cities. Inside zones, rates dropped to 3.7% to 13.2%, respectively.

Fisher and Peters,^[47] using their hypothetical firm approach, offer the best evidence about EZs. Cities with EZs usually offered more generous incentives than cities without zones, but "enterprise zones are little more than geographically targeted versions of standard state and local economic development programs."^[47] However, state corporate income tax credits were more prevalent and more generous in EZs than statewide, and policymakers employed jobs credits twice as often as investment credits within EZs (see also, Ref.^[48]). Zones tended to offer incentives worth two to three times those available statewide.^[47] Within EZs, zone incentives accounted for one-third of the incentives offered.

Most jobs in EZs come from expansions of existing zone businesses and from new businesses, rather than relocations.^[21,49] In a study of 357 zones in 17 states, 26% of 1,623 zone firms making new investments were new firms. 8% were new branch plants of non-zone firms and 9% were relocations from outside the zone. "If EZs had been established to nurture new business development, the incentive programs would have been structured quite differently and an emphasis would have been placed on small business incubators, technology transfer programs, management assistance and venture capital provision."^[47]

HOW WELL DO EZ INCENTIVES WORK?

Literature suggests that targeted populations and businesses do not necessarily benefit from EZs. Frequently, incentives negatively impact zones.

Incentive Beneficiaries

Job tax credit programs may not induce jobs, because many firms cannot fully use them. Most job tax credits have a statutory ceiling and are one-time credits.^[47] For 13 states with job tax credits in Fisher and Peters' study, firms in 6 states used 100% of credits available. But in the other states, firms used only 67% of the credit on average. Job tax credits did not induce employment as expected. Job tax credits may have no price effect at the margin, meaning that all other costs being equal in other locations, these taxes may have little impact on firm costs of business.

People who ought to benefit from EZs may not. Shocks or subsidies in labor markets only temporarily

reduced unemployment in targeted areas. In-migration of workers to a targeted area quickly eliminated benefits to original residents. In the long run, new in-migrants to a targeted area took many newly created jobs.^[50] Bartik,^[51] in reviewing 18 studies, calculated that 60% to 90% of jobs created by employment programs go, in the long-run, to in-migrants rather than the targeted beneficiaries. Ladd (Ref.^[52] see also Ref.^[53]), in her literature review of EZs, surmised that place-based subsidies and even people-based, place-based subsidies failed to raise employment levels and well being of targeted residents.

Minority businesses were not attracted to EZs. Glover^[54] surveyed zone firms and administrators, finding that only 5% of firms were minority-owned.

Capital Investment Incentives

Not all incentives increase employment; some actually decrease it.^[22,30,48] Nationally, wide variation exists in the mix of labor and capital incentives inside and outside zones, ranging from 0% to 100% focus on labor.^[47] Typical capital incentives clearly have much larger effects on the price of capital goods than average labor incentives have on wages. The exemption of capital equipment from a 6% sales tax reduces its acquisition cost by 4% to 4.5%. A 1% state investment tax credit reduces the price about 0.65%. Average jobs credit per job, represents only 0.2% to 0.5% of present value of wages over 10 years. Maximum jobs credit represents from 1% to 1.6% of present value of wages over this period. Incentives that lower the price of capital goods have both an output effect (production and employment increase because costs are lowered) and a substitution effect (capital is substituted for labor). If the substitution effect is stronger, a capital incentive could reduce employment. Loh^[55] looked at county-level growth in Ohio in the 1980s as a function of economic incentives, concluding that capital subsidies to private businesses were more effective than either labor subsidies to private businesses or capital subsidies to communities. However, Loh's work has been roundly criticized.^[47]

EZ Size

If every community is an EZ, the program breaks down. For example, an existing EZ in Jefferson County, Kentucky was expanded due to political pressures. The expanded EZ included new zone areas that did not fulfill the minimum socioeconomic requirements put forth in Kentucky's EZ legislation, but the overall zone's economic vital signs were still low enough to qualify.^[35] Arkansas and Kansas have EZs

that cover the whole state.^[2] In 1995, South Carolina designated 90% of the state an EZ. Some states designated entire counties. Critics suggest that this misconstrues the intent of geographically small area targeting. Small area targets do not significantly affect economies, either positively or negatively, so partial equilibrium models apply. When zones get too large, full equilibrium models apply. Full equilibrium suggests that transfers of wealth from one area to another reduces wealth in the entire economy (see Ref.^[48]).

State Government Administration in a Federal System

Timothy D. Mead

*Department of Political Science, University of North Carolina at Charlotte,
Charlotte, North Carolina, U.S.A.*

INTRODUCTION

American federalism has never been static. Yet, each ebb and flow of the relative weight of the national government and the states in policy making has left the national government stronger than it was before. The rise of a national economy, the increasing technology of warfare and national defense, and the development of policy problems only subject to resolution on a large scale have all contributed to the secular increase of power in the hands of the national government.

SIGNIFICANCE OF STATES IN THE U.S. FEDERAL SYSTEM

By definition, a federal system is a method of governance with multiple levels of government. Often the argument is made that the particularly successful innovation in governance struck off at the Constitutional Convention was a federal structure. Yet, as a political matter, the Founding Fathers had no choice other than to recognize the existence of the states. The colonies, which became states, were already in place and, during the period of the Confederation, had substantial independence from one another. In 1787, a federal system by one form or another was a *sine qua non* of a national government.

This is not to say that the role of the states did not get attention at the Constitutional Convention. On July 17, 1787, the Virginia Plan, advocated by the largest and most powerful of the states was debated. It would have permitted Congress “To negative all laws passed by the several States contravening in the opinion of the Nat: Legislature the articles of Union.”^[1] Only two states—Massachusetts and Virginia—voted for this provision.^[1] Further, the Constitution as ultimately adopted over 200 years ago guarantees the integrity of the states by providing that no state shall be divided without its approval.

While the provision that Congress could veto state laws did not pass, another provision, the Supremacy Clause, made the states subject to national law. Indeed, a case could be made that the Supremacy Clause made state laws subject to veto by the judiciary rather than the legislature. Early in our constitutional history, the

capacity of the national government to establish its laws within the states was challenged by the Kentucky and Virginia Resolves, which would have permitted the states to determine whether Congress had exceeded its powers. Ultimately, a “great war” was fought to resolve the relative balance of the national and state governments.

Once states are admitted to “this Union” by Congress, they stand on an equal footing vis-à-vis all other states. As a constitutional provision, this has meant that there have been no “second class” states, thus assuring that territories would seek statehood rather than independence.

THE RISE OF A FEDERAL POLICE POWER

The Tenth Amendment to the Constitution appears to be a significant grant of power to the states. It provides, “The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.” Popular discussion of the Tenth Amendment often asserts that it reads “expressly delegated,” yet both houses of Congress rejected the insertion of “expressly.” As the Supreme Court noted in *United States v. Sprague*,^[2] the Tenth Amendment “added nothing to the instrument as originally ratified.”

Yet, as a written document, the Constitution created a government of limited powers, that is powers that are granted to the national level of the federal system. A general power “to regulate the public health, welfare, morals and convenience,” often called the police power, was not included in the grant of powers to the national government. Roughly, from the death of Chief Justice John Marshall in 1835 to the New Deal, the absence of a federal police power was often argued as the basis for the exercise of various state police powers.

Dual federalism, the notion that the Constitution created two separate, coequal sovereignties, was the dominant constitutional argument. National and state governments were each perceived to be supreme within their individual spheres. The powers granted to one level were limits on the other. *Hammer v. Dagenhart*^[3] represented the legal highwater mark of dual federalism when the Supreme Court struck down a

congressional enactment banning the interstate shipment of goods produced by child labor. Dual federalism was specifically rejected by the Supreme Court in *U.S. v. Darby*,^[4] when *Hammer v. Dagenhart* was overruled and the Court accepted the extension of national labor laws to businesses that had an impact on interstate commerce. In *Darby*, Justice Stone asserted that the Tenth Amendment was a “truism that all is retained which has not been surrendered.”

Over time, however, a federal police power has developed, seriously eroding the powers of the states in the federal system. Several streams of constitutional development have contributed to the rise of a federal police power and a concomitant diminution of the discretion of the states.

Among those streams is the interpretation of the “necessary and proper” clause^[5] to mean “convenient, or useful, or essential” to carrying out one of the enumerated powers.^[6] Thus, the national government may exercise a power not in the list of powers granted that may be implied from that list. The significance of this interpretation in the development of the federal system cannot be overstated.

Another stream in the development of a federal police power is the expansion of the power “to regulate commerce . . . among the several States.”^[7] In a landmark decision, Chief Justice Marshall held that the power to regulate commerce, to “establish the rule,” was not limited to the transfer of goods across state boundaries but included the entire transaction.^[8] This decision created the legal foundation for a national economy. As the Industrial Revolution transformed the American economy, the grounds for national, as contrasted to state, administration of the economy was laid. National authority over the economy rapidly led during the 1930s to national regulation of a variety of activities previously administered by states alone.

Further, the power to tax and spend^[9] has served as a tool in the development of a national police power. The power to tax, for example, has led to a host of special provisions in the tax code to encourage individuals and businesses to engage in practices deemed to be in the public interest; some call these provisions loopholes, while others find them appropriate incentives. Examples include tax deductions for home mortgages, credits for funding research, and a host of others. The power to spend has permitted Congress to enact provisions of appropriations designed to encourage—some would say require—recipients of national government funds to modify personnel practices, establish speed limits on highways, establish minimum age requirements for the consumption of alcohol, and permit right turns on red-traffic-signal-controlled intersections.

Critical, from the perspective of the rise of a federal police power as a constraint on state administration, was the adoption of the Fourteenth Amendment.

It provides, in part, “nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws.” While early interpretations of the Fourteenth Amendment were restrictive of its application,^[10] subsequent decisions upheld national regulation of the purity of foods and drugs, the hours and wages of labor, access to the courts, and a panoply of services that the Founding Fathers could not have anticipated.

While there are other streams that contribute to the development of a national police power, these cited are most critical from the perspective of state administration. And the development of a national police power is significant from the perspective of state administration because that combination of powers has shifted the balance of policy-making responsibility, and the parallel administrative responsibility, from the states to the national government. The upshot of the development of a national police power has been that in many ways, the states have become administrative agents of national policy.

Mandates, national requirements that states do something in particular or do things in particular ways, spring from the national police power. Mandates may take the form of direct orders, for example, to observe the requirements of the Occupational Safety and Health Act protecting workers. Mandates may be crosscutting regulations that affect all, or virtually all, national programs, for example, requirements of Environmental Impact Statements before national funds can be spent. Mandates may be crossover sanctions requiring that states do something before national funds may be spent on something else, for example, the various highway safety rules that states must adopt before they may spend national highway construction funds; such mandates, of course, are only apparently optional. Or mandates may be preemptive, in which the national government adopts a standard, for example, for the permitted amount of arsenic in drinking water but allows states to adopt a more rigorous standard.

In one fashion or another, there are hundreds of such national mandates. Those most onerous from the perspective of states are the unfunded mandates, national requirements that states do one thing or another that will require the expenditure of funds by the states without reimbursement by the national government.

NATIONAL ADMINISTRATION AS A MODEL FOR STATE ADMINISTRATION

National administrative practices have often served as models for state practices. Early in our national

history, administration of all government programs was done by patronage; a variety of rationales were offered to support such administration.

Multiple forces came together to replace administration by patronage with administration by a career civil service. In 1883, the national government adopted the Pendleton Civil Service Act, which created a career merit system for employment by the national government. Following the model of the national government, roughly three-quarters of the states have adopted requirements of a career civil service. In the balance of the states, programs supported by federal funds are required to hire and fire according to standards of a career service. Partisan loyalty as a requirement of state employment was rejected by the Supreme Court in *Rutan et al. v. Republican Party of Illinois*.^[11]

Another example of the national government as a pacesetter for state administrative practices is the 1946 Administrative Practices Act. This act established standard procedures for federal agencies, including guidelines for rule making, public hearings, judicial review of administrative decisions, and a host of other practices that are now taken for granted as appropriate administrative practice. In more recent times, the Privacy Act of 1974 and the Freedom of Information Act of 1966 have been amendments to the national Administrative Practices Act. Following the lead of the national government, all states have adopted an administrative practices act, which includes various elements of the national legislation.

Further, as the national government has adopted one or another of the “hot” practices of public administration, Program-Planning-Budgeting-System in the 1960s, Zero-Based Budgeting in the 1970s, Management by Objectives in the 1980s, and Reinventing Government in the 1990s, many states have followed suit.

RECENT HISTORY OF ADMINISTRATIVE FEDERALISM

Since World War II, every presidential candidate save John Kennedy in 1960 and Lyndon Johnson in 1964— independent of political party—has made the case that the national government was too intrusive and that states should be strengthened. The irony, of course, is that the long-term trend toward greater national influence has continued. As a current example, President George W. Bush has urged greater state responsibility for the conduct of primary and secondary education and a series of national tests to assure the accountability of state educational success.

President Reagan, perhaps, had the most clearly defined concept of federalism of all the postwar presidents. His concept was a return to the doctrines of dual federalism, described above. His “New Federalism”

proposal for “swapping” of programs with the collective states and “turnback” of programs he believed the national government had usurped over time was not adopted by Congress. Yet many elements of it were included in the Omnibus Budget and Reconciliation Act of 1981, including the consolidation of 57 national grant-in-aid programs into nine block grants. And the Reagan perspective set the tone of the debate over federalism for the balance of the twentieth century and into the twenty-first.

“Devolution” has been the standard position of national politicians. What devolution has come to mean is that the national government will provide block-grant funding to states and sufficient oversight and administrative support to states to assure that national requirements are met, for example, that civil rights protections remain in place; yet, the states will be free to adopt diverse and innovative practices.

Perhaps no policy area better demonstrates the devolution thrust in national-state relations than the Personal Responsibility and Work Opportunity Act of 1996. This legislation, in the words of President Clinton, “ends welfare as we know it.” Rather than the categorical grants to states provided under the New Deal era Aid for Families with Dependent Children (AFDC), the new program provides a block grant to the states, and the states are to address issues of family poverty in individual and innovative ways. Unlike AFDC, the new legislation limits the time that dependent families may remain recipients to five years and requires that after two years of receiving assistance, adults would be required to find work or participate in state-certified work programs. A generation of program evaluation will be required before an assessment of this particular devolution can be made; it is, certainly, the central piece in the devolutionary thrust.

PROSPECTS

Among the futile enterprises in American politics and administration is the debate concerning the “intention of the Founding Fathers.” Imagine the amazement of the representatives to the Constitutional Convention if they were told that they needed to anticipate the regulation of images sent through the air and received by electronic boxes in the living rooms of virtually 250,000,000 Americans! Or that the national government would need to take the lead in research to fight a devastating attack to the human immune system that would arrive from Africa!

The dual federalism assumption that national and state responsibilities could be easily and understandably separated was not demonstrable during the heyday of dual federalism. At the peak of the dual federalism period, multistate corporations were demanding that

the national government regulate commerce to protect them from the vagaries of regulation by the states.

Yet the debate continues. In the last two decades, the driving force of change in the federal relationship has been the availability of federal funds. A strong case can be made that the objectives of the Reagan New Federalism were reached not so much through the transfer and swapping of functions as through the reduction of national revenue caused by the 1981 Economic Recovery Tax Act and the ensuing declines in appropriations. In turn, state governments were compelled, for political reasons if not administrative, to assume funding those programs they thought most important to continue.

In mid-2001, the future of federalism appeared to depend on the use of the projected national government budget surplus and the long-term implications of the tax cuts enacted in early 2001. The tragic events of September 11, 2001, however, set off a series of events that consumed the projected national government budget surplus.

And the policy debate that ensued illustrates how easily the national government is compelled by political demands to accept responsibility for elements of shared national-state responsibility. For example, during the debate over airport security, that there was a national government obligation to assure public safety—a police power—was a given. The controversy was whether that meant that airport security would be provided by federal employees or that the national government would merely establish standards and assure that they were reached.

This example merely captures the dynamic of the federal administrative history. Problems arise. Politicians respond, as is appropriate in a democratic society. National and state governments share, based on the availability of resources, political factors, and diverse other considerations, responsibility and accountability for resolution of the particular problems. In a dynamic federal system, no distribution of power in the federal administrative system and the role of the states in it can be permanent.

State Government Administration of Rural Development Policy

Michael McGuire

Department of Public Administration, University of North Texas, Denton, Texas, U.S.A.

INTRODUCTION

State government administration of rural development policy refers to the activities directed toward the economic and cultural development of rural communities that are undertaken by administrators in state government departments, agencies, and affiliated organizations. These activities may include providing resources such as finances, information, and expertise; direct service delivery; indirect service delivery by coordinating development efforts across multiple communities and/or through various state agencies; designing comprehensive development strategies by linking related programs; and establishing relationships with administrators in both federal and local government, and with non-governmental actors in communities. No single administrative activity is more important than another, and the degree to which state government administers development policy through these activities will vary according to the needs and capabilities of individual communities.

DEFINITIONS

The term “rural” describes any city, town, township, village, county, or unincorporated community that is not located within a metropolitan statistical area, as defined by the United States Office of Management and Budget and applied to United States Census Bureau data. Rural communities thus include small-to medium-sized non-metropolitan localities of up to 25,000 in population, as well as the majority of communities that are inhabited by fewer than 10,000 persons. Rural communities are unique, not just in terms of size and location; these communities are more likely than urban and suburban communities to face challenges related to structural changes in the economy, such as low skill and resource densities, lack of specialized expertise and information, isolation, and limited access to urban amenities. Although not all rural communities are alike, these internal forces have contributed, in general, to dwindling populations, relatively low wages, above average incidences of poverty, and a declining institutional infrastructure.

“Development policy” refers to the totality of programs designed to generate an acceptable quality of life for rural residents. A state’s rural development policy is the package of goals, strategies, policies, and programs that in some way promotes the growth and development of rural communities.^[1] Some programs focus on directly stimulating or maintaining business activity and/or employment, whereas others are designed to improve the physical, social, and cultural attributes of a community as a means to indirectly affect income and employment. Fundamental programs addressing taxation, regulation, and education comprise a state’s rural development policy, as do more targeted programs that compensate for perceived market failures, such as training, business financing, direct investment, trade assistance, and promotion. Rural development policy is an arena in which the federal government traditionally played the leading role, although the focus of federal rural policy historically has been on agriculture rather than on the larger issue of enhancing the physical, social, cultural, and economic well-being of rural communities. In response to federal disengagement beginning in the late 1970s and resource deficiencies across all levels of governments, state governments have sought to broaden their development focus to include the revitalization of rural cities and regions.

REASONS FOR STATE INVOLVEMENT

State government is in the best position administratively and politically to affect the development of rural communities. First, in contrast to the first three-fourths of the twentieth century, the national government has not recently played a leading role in rural development. As the condition of rural communities worsened during the 1980s and early 1990s, interdependencies between rural communities and the overall state economy became apparent. Almost by default, the well-being of rural residents became the responsibility of state government. Second, states know better than national or local governments the extent to which rural problems affect the economy and culture of the entire state. Even in states with prosperous and growing urban economies, rural problems can become a drag

on the state economy. States are able to foster the critical economic and social linkages across rural communities, and between urban and rural communities, without which the entire state economy could suffer; this is the “weakest link” argument. Market failure in rural areas may be so severe that state intervention in rural areas can improve the efficiency of the state’s economy.^[2] Third, success in preserving rural communities will ultimately rest on genuine local preferences orchestrated through coordinated collective action. States are able to tailor policies to specific local circumstances, to provide assistance to communities seeking to take charge of their future, and to design policy responses around local plans and strategies.^[3]

CHARACTERISTICS OF STATE GOVERNMENT ADMINISTRATION OF RURAL DEVELOPMENT POLICY

State administrators do not “do rural development,” but rather they undertake activities and tasks as a means to affect the development process in rural communities. The focus of state activity since the 1980s has been on designing the administrative processes and structures that are most appropriate for the unique features that differentiate rural development policy from other state policy areas. The administrative issue of determining how best to deliver development policy for rural communities has in many ways transcended the evaluative issue of what programs work best for rural development; much is known about the processes of development, but states are learning the importance of constructing the proper public technology for delivering goods and services to communities.^[4] Certain characteristics of state rural development policy distinguish it from other policy activity.^[5] These characteristics accurately depict the challenges faced by state administrators.

Rural Strategy is Crosscutting

One unique quality of state rural development policy is the way that place, rather than socioeconomic conditions, drives the content of rural policy in the states. What constitutes rural development is only partially a function of poverty or education levels; some states dedicate more resources and energy to rural development activities simply because there are more rural jurisdictions in that state. Although rural policy cannot be framed in terms of a choice between people or places, the most successful state efforts in developing rural communities have been place oriented to the extent that activities are designed to facilitate the ability of communities to plan and implement

development programs on their own. These efforts involve not only the development of the local economy but also improvement of local physical infrastructure, strengthening of local institutions, and enhancement of the social and organizational infrastructures.^[6] Persons ultimately receive the benefit of state action, but the place is the primary unit of analysis for state administrators.

Because rural problems can be identified as “rural” by definition, rather than in terms of particular functions, the responsibility for developing rural communities does not rest with any single agency, department, or office, or even a single set of designated agencies. Indeed, many models of structuring rural development policy can be found among the states, none of which can be considered any more effective than the other since the constituents and circumstances of rural residents vary significantly throughout the country.^[2] For example, states such as Iowa and Nebraska, which have approximately one-half of their population living in non-metropolitan areas, administer rural development through specialized divisions located within a larger department of economic development. The state of Texas, which has the largest total rural population of any state, but constituting only 15% of its population, has an Office of Rural Affairs through which general economic development programs—revenue bonds, enterprise zones, and Main Street, for example—are targeted to rural areas. The divisions in Iowa and Nebraska employ larger staffs and include more rural-oriented programs than does the office in Texas. On the other hand, Vermont, which has the highest percentage of all state residents residing in non-metropolitan areas, but ranks 39th in total rural population, has some specialized rural programs, but these are administered through the Department of Economic Development like all other urban development programs.

One factor contributing to the multiple administrative locations of rural development policy in the states is the nature of the policies that actually affect rural communities. Rural and urban communities are not easily distinguished with standard economic and social measures, so state policy makers often have little incentive to design a host of rural-specific programs. Crosscutting policies such as taxation, education, regulation, and health care are standard functions of state government that are not explicitly directed to, but still significantly impact, rural communities. However, it is difficult to unravel the part of these strategies and programs that specifically benefit rural areas. State administrators in many different departments forge special rural initiatives, such as the offices of rural health or special rural education programs and institutes located in state universities, while also applying generic programs that benefit rural areas.

Information is the Most Important Resource

A second distinguishing characteristic of state administration of rural development policy is the prominence of information in the total array of policy-making resources. Contrary to the traditional view of rural development as being income and/or agricultural support, an effective rural policy focus is based on important non-financial resources: information, specialized expertise, and the capacity needed to mobilize public and private resources.^[7] A significant portion of the goods and services provided by the states is thus information based. Even in programs providing financial assistance to rural communities, there is a large information-based, technical assistance component.

One of the most essential tasks undertaken by state administrators in rural development is gathering information about the conditions of rural communities and assessing the capacities of the institutions and people in these communities. By providing such information, administrators attempt to reduce uncertainty felt by communities and to raise the level of information about the applicability and merit of rural development activities. State policy makers and administrators provide information so that local administrators are able to more capably fit development policy activities with the problems and objectives of the community. In most cases, the informational demands are so great that state officials must provide road maps to guide local officials through the bewildering maze. In addition to providing information directly to communities, effective state administrators will guide prospective lenders to the right sources, make contacts, help in preparation of applications, advocate on behalf of communities, and follow through on the progress of local activity.

Information is also necessary to coordinate the various rural programs. State administrators interact with communities on behalf of the programs administered for other state agencies. For example, a state administrator in an economic development agency understands that communities may seek basic information and an interpretation, or attempt to make a program adjustment, regarding a specific funding program.^[8] As a broker of information, that administrator will work with loan and grant program officers, other state administrators, and the community representative. Similarly, a community request may be external to the development agency, for example, for road funding from the state highway department or for a construction permit from the state environment agency. In such a case, it is necessary for the state rural coordinator help make the contact, assist in applications, advocate, and follow through.

Many of the most important tasks undertaken by state agencies include developing leadership in rural communities, helping a community develop an

understanding of its local economy, conducting institutional and environmental evaluations, and assisting a community in establishing priorities for the purposes of designing and implementing strategic development plans.^[9] These rural capacity programs are generally operated out of state economic and community development departments. Many state government efforts include programs in leadership training, which focus on developing organizing skills, increasing residents' substantive knowledge of development, and exposure to "best practices" experiences in other communities; community assessment, which provides training in environmental needs assessment, goal setting, consensus building, developing visions, and undertaking a strategic planning process; and institution building through small grant programs that support local non-profit development agencies delivering services to rural residents.

Collaborative Administration

Another important characteristic of rural development policy that has become increasingly salient over time is the state's reliance on multibureaucratic, multiorganizational, and multisectoral mechanisms for producing, providing, and administering development services to rural communities. Faced with the need to provide financial resources to enhance local revenues, as well as information and expertise to compensate for the complexity and uncertainty inherent in the policy area, the state rural development administrator has become dependent on many other actors in and outside of the community. States recognize that dependencies exist among a host of private and public organizations for scarce economic resources that have, in turn, induced a new set of governing responsibilities for affecting the process of development. The governance instruments through which states and rural communities cities now plan, design, and execute development policy are complex multiorganizational networks built upon the idea of collaborative problem solving.^[1] Such networks are not merely mechanisms for coordination, but arrangements for solving interorganizational problems that cannot be achieved by single organizations.^[10] Thus, the most salient administrative and institutional arrangements in state rural development policy are not functional and agency driven, but instead are often based in public-private and state-local linkages.

Rural development is not a specific service designed and administered directly by government personnel. Intergovernmental activity for state program officials increasingly means establishing linkages among resources and programs through task forces, partnerships, and networks composed of both state and

non-state employers. The intergovernmental linkages that are required for formulating and implementing economic policy have resulted in a public administration involving multiple persons from multiple agencies in multiple jurisdictions administering multiple policies and programs. Bureaucratic structures still characterize the agencies and organizations involved in rural development, but these bureaucracies do not act alone. Instead, multiple bureaucracies collaborate on projects, design policy together, develop joint strategies, adjust mechanisms for operation and implementation, and formulate some means for determining whether expected results are being accomplished.^[11] The linkages that comprise the networks designed for one particular strategic purpose are often not the same as those in networks addressing another purpose.

EXAMPLES OF MULTIAGENCY, INFORMATION-BASED COLLABORATION

There are numerous institutional arrangements representative of the information-based, multiorganizational nature of state rural development. The Mississippi Development Authority, the department charged with administering economic and community development in a state with the seventh largest number of rural residents of any state in the country, offers a large number of information-based programs for communities that involve linkages across agencies and sectors. These programs include the Competitive Community Program, which incorporates elements of community analysis, group skills enhancement, and strategic planning into a program involving local chambers of commerce and volunteers. The Community Development Fund administered by the Iowa Community and Rural Development agency provides financial and technical assistance to groups that emphasize local partnerships and regional approaches as part of a local development strategy.

Intergovernmental partnerships known as state rural development councils (SRDC) have become a national model for procuring and sharing information, while jointly designing development strategies. Begun with 8 pilot councils in 1990, 40 councils now operate in the United States. Each SRDC involves representatives from federal, state and local government, tribal governments, and non-profit and for-profit organizations. State rural development councils play a significant role in helping states define its rural development mission and advising state agencies on how best to carry out that mission. Such councils advocate and recommend programs designed to foster community and economic development initiatives in rural areas, provide a voice for the needs and interests of rural residents and businesses, and complement local efforts to improve the

quality of life in rural areas. The SRDCs receive small operating budgets from the federal government and state-in-kind matches provide for a very small staff.

States incorporate SRDCs into the policy making and administrative structure in various ways. In most states these councils act in concert with state agencies but are separated administratively from the state government structure; such councils are established as non-profit corporations. Others may be affiliated with various agencies, such as Iowa's Rural Development Council, which is housed at the Iowa Department of Economic Development within the Division of Community and Rural Development, and California's RDC, which is located administratively within the state's Trade and Commerce Agency, with the secretary of trade and commerce serving as chairperson of the council.

CONCLUSION

Public administrators working in rural development at the state level face daunting challenges that administrators in other policy areas do not face: Action is determined by geographic rather than purely socio-economic factors; several agencies are involved in administering policy, often without an explicit, comprehensive direction; information is the most important resource in demand by communities and supplied by state administrators; and numerous organizations across governments and sectors are necessary for adequately designing and delivering development goods and services to rural communities. Administrators establish linkages with other governmental jurisdictions and multiple communities while administering numerous programs housed in many different agencies. Service design and delivery is increasingly through partnerships of public and private actors, rather than by a dominant state agency in possession of all policy-making resources. As a result, rural development administrators at the state level find themselves working with and through other agents to help communities help themselves.

State Government Administration, Impacts of Reform Movements

Cynthia J. Bowling

Department of Political Science, Auburn University,
Auburn, Alabama, U.S.A.

INTRODUCTION

Since at least the 1880s, governmental reform has been a prominent theme in mainstream politics, as well as in public administration theory and practice. From beginnings in the Progressive Reform movement has come a never-ending quest for effectiveness, efficiency, economy, and/or equity in government operations. This course continues today in the most recent wave of reform, commonly known as “reinventing government.”

Once known as the “fallen arches” of the federal system, the American states have gone from being considered only a “funnel” through which national programs and policies reached localities, to “governing in new and traditional spheres and responsibilities and . . . doing a better and better job at it.”^[1] States are now considered policy innovators and laboratories where administration is more professionalized, streamlined, and performance-focused than ever. This new state persona is the result of three waves of reform movements. In fact, Bowling and Wright characterize the impacts of state reform as an “administrative revolution.”^[2] In this article, three historic periods of reform and the impacts (broadly defined) they have made on state government are discussed.

WAVES OF ADMINISTRATIVE REFORM: REFORM MOVEMENTS AND THEIR IMPACTS ON STATE GOVERNMENT

Over the last hundred years, three waves of reform have swept into state government: *Rising Tides* (the period from 1915 to the early 1960s), *Cresting Waves* (1965 to late 1980s), and *A New Current* (the 1990s to the present). For each period, the major reform impetuses and a number of potential impacts are discussed within five broad categories: 1) *constitutional/statutory*; 2) *structural*; 3) *gubernatorial powers*; 4) *personnel*; and 5) *procedural*. Table 1 displays each of these movements, related goals and catalysts of reform, and the major changes occurring within each wave.

1915–1965: Rising Tides

The first reform movement was based on orthodox administrative principles and scientific management advocated by the Progressive Reformers. Responding to patronage, spoils, graft, and corruption occurring in the latter half of the nineteenth century, the Progressive Reform movement ushered in both political and administrative changes in local, state, and national governments.

The Progressives had a difficult path before them. Governors were traditionally weak figureheads. State agencies, in an effort to curtail corruption, were increasingly headed by independently elected executives and by boards and commissions. The constitutions of many states were antiquated and, when rewritten, contained detailed agency functions and structures. With constitutionally based organizations, other agencies had to be created separately by statute whenever new needs arose. In essence, state government was uncoordinated, unconsolidated, and uncontrolled.

According to tenets of scientific management, if government can create the correct structure or organization for administrative operations, efficiency and accountability will inevitably follow. The work of Woodrow Wilson, Frederick Taylor, and Luther Gulick is indicative of the search for the principles and institutions that would provide this efficiency. President Taft’s Economy and Efficiency Commission in 1912 spurred many states to action. One of the first persons to describe state reorganizations, A. E. Buck,^[3] identified a number of standards for reform that are indicative of the administrative principles advocated for state government: 1) concentration of authority and responsibility (especially under the governor and appointed department heads); 2) integration of functions into departments; 3) fewer boards and commissions for administrative purposes; 4) coordination of staff services; 5) independent auditors; and 6) recognition of a governor’s cabinet. The main focus during this time period was reorganization reflecting these standards.

Table 1 Reform movements, catalysts, and impacts

Reform movement	Reform catalysts	Main impacts of reform movement				
		Constitutional and statutory	Structural	Gubernatorial powers	Personnel	Procedural
Rising Tides (1915–1965)	• Progressive Reform movement • Scientific management • Taft Commission • Brownlow Commission • Hoover Commissions	• Reform primarily by legislative statute	• Consolidation of agencies by function • Statutory limits on number of state agencies	• Introduction of short ballots • Increased appointment powers • Lengthening of governors' terms • More centralized budget processes	• Limited gubernatorial staffs • Slow increase in civil service coverage for state employees	
Cresting Waves (1965–1980s)	• Diffusion of “first-wave” reforms across American states • Increased scope of state responsibilities	• Major constitutional amendments or new constitutions in 40 states	• Less constitutional control over agency structures • Continued consolidation by function; creation of superdepartments	• Gained ability to order executive branch reorganizations • Increased appointment and removal powers	• Increase in size of governor and legislative staffs • Continued increase in use of merit systems • Rapid improvement in quality and diversity of agency heads	• Varied and dispersed innovations in budgeting processes and management styles
New Current (1990s–Present)	• Faltering economy • Reagan devolution • Budgeting and management innovations • Publication of <i>Reinventing Government</i>		• Continued executive branch reorganizations across the states			• Reinvention initiatives • Strategic planning • Privatization or “contracting out”

James Garnett^[4] reports that this reform movement began impacting state government in 1915, primarily through a series of reorganizations spanning the next five decades. Three main reorganization efforts impelled these changes. First, although not implemented, New York produced plans to restructure executive operations in 1915, elements of which diffused across several states. In 1917, Illinois became the first state to enact major executive branch reorganizations. Twenty-five other states reorganized at least part of their executive branches over the next two decades.^[1] The second catalyst for change was the federal report on administrative practices and principles released by Luther Gulick and the Brownlow Commission in 1937. Immediately following its release, another 12 states were involved in reorganization and reform efforts.^[1] Finally, after World War II, reformers began focusing not just on proposals arising from the national government but also began a search for the states' own prescriptions. Many states enacted "little Hoovers" based on the most recent federal studies of administrative practices (the Hoover Commissions in 1949 and 1953). Reports and innovations began to spread from state to state. The adoption rate of reform proposals studied by Garnett almost tripled after World War II compared to those initiated in the earlier part of the century.^[4]

The majority of these early reorganizations was instituted by *statute*, with constitutional amendments taking much more effort to pass. Consequently, the impact of reforms was limited in scope.^[4] According to Garnett, moderate *structural* changes took place. The number of agencies was reduced in many states. For instance, in 1926, a constitutional amendment and statutory changes in New York resulted in limiting the number of departments to less than 25. Just prior to this change, there had been over 150 different agencies. Consolidation of function and authority occurred, merging agencies into statutorily defined departments. However, these reorganizations also had the effect of institutionalizing some department and agency structures within constitutional or statutory guidelines, allowing only limited discretion for reorganizations that became necessary with the Great Depression and World War II.

There were also limited improvements in the *gubernatorial capacity* to lead state agencies. One advocated reform was the short ballot, which limits the number of major departmental executives elected separately from the governor. Tennessee, New York, and Virginia were most "progressive" with the short ballot and consolidation, with partial changes in at least eight other states.^[1] This trend was quite limited, though, with a number of the states still electing several major department heads today. For instance, at least nine different high-level executives are elected separately from the

governor, including a powerful lieutenant governor, in Alabama. In other states, the governor did gain the ability to make a larger number of executive appointments at the department level, and the number of elected boards and officials governing agencies began to slowly decrease.

Other formal powers of the governorship increased during this time as well. By 1955, almost one-third of governors had four-year terms, instead of the one- or two-year terms prevalent earlier in the century.^[5] This allowed the governor to govern more and campaign less. The governor was also gaining the ability to control the budget process, with budget creation and implementation increasingly centered in the governor's office. During this time period, however, *staffing* the governor's offices and departments with adequate numbers of qualified persons remained somewhat problematic. The staffs remained small, limiting the ability of the governor to control and coordinate the departments' activities despite the more centralized budget processes. At the end of this wave of reform, the average size of the governor's staff was still only 11 persons.^[5]

Finally, professionalism in state administration improved very slowly in the first half-century. In 1938, over 55 years after the passage of the Pendleton Act, less than one-third of the states had a merit-based personnel system,^[3] though professionalism continued to steadily improve. By 1960, about half of state employees were covered by some sort of civil service system.^[1]

1965–1980s: Cresting Waves

The impact of the first movement was limited in scope and adoption but set the stage for the next wave of reform and reorganization. The reforms that began in some states in the first half of the century, with variations in degree, began to occur across the country. It seems as if the "scientific management" goals of the previous wave had finally, fully poured into state government. These reforms were culminating in what Bowman and Kearney have described as the "resurgence of the states."^[1] This resurgence occurred not only in administrative capacity but also in the scope of state policies, programs, and responsibilities. As the states were called on to implement federal policies in the 1960s, and then as policy making and program implementation devolved in the early 1970s, reforms rapidly developed.

Perhaps the preeminent impact of this wave of reform was the *constitutional* changes that occurred. Legislative statutes had been responsible for most of the reforms and reorganizations in the first half of the century. Between the mid-1960s and the

mid-1980s, however, almost 40 states experienced sweeping constitutional changes or the ratification of new state constitutions.^[1] Most constitutions were streamlined and clarified, reflecting aspects of the revised Model State Constitution created by the New York Municipal League. A major impact of these transformations was an increase in the institutional powers of the governor and legislature, while erasing specific administrative provisions from the bounds of state constitutions. Further, Bowman and Kearney report that the constitutional changes triggered other internal administrative adjustments across the states.^[1]

Improved organizational structures also appeared. Between 1965 and 1975, 20 states enacted a major reorganization of the executive branch and another 24 reorganized at least one agency or department.^[1] During this time, many states consolidated agencies by functional area into 12 to 20 superdepartments headed by governor-appointed executives.^[1,2]

Even more important was the increased ability of governors to order executive branch reorganizations themselves. In 1956, only two governors had this power. As part of the movement to strengthen gubernatorial influence over executive branch activities, governors were increasingly allowed to reorganize by executive order. By 1994, 22 governors had gained this capability.^[5] Several states also increased the governor's appointment and removal capacity. With the addition of removal powers, the governor gained another potential tool for influencing state administration and policy. In 1980, about half of major state administrators were appointed by the governor. Though Bowman and Kearney^[1] and Beyle^[6] found appointment power limited by the long ballots present in most of the states, sunset provisions and other legislation began decreasing the numbers of separately elected boards and commissions.

The *professional* resources of the governors' offices also increased. In the mid-1980s, governors' staffs averaged 25 persons;^[1] by 1994, that average had increased to 54.^[6] Larger staffs added the ability to plan, organize, and coordinate agencies, as well as provide information to the governor in a timely manner. Additionally, planning agencies were added to these staffs. In 1960, 37 states had planning departments but only 3 of those were located in the governors' offices. By the mid-1970s, all states had planning departments; 29 were directly under gubernatorial control.^[5]

The quality of personnel improved as well. The most rapid improvements in both education levels and diversity were between 1964 and 1984. Bowling and Wright^[7] report that the number of state agency heads with a graduate degree rose from 40% in 1964 to almost two-thirds of administrators in 1984. The percentage of agency heads without a college degree

dropped from 34% in 1964 to only 8% in 1984. The numbers of minority administrators rose from about 2% in the 1960s to 10% in 1984. Minority representation has remained at this level since the early 1980s. The proportion of women executives has steadily increased from only 2% in 1964 to over 22% in 1994. Additionally, over three-quarters of all state administrators are now covered by a civil service merit system.^[2]

Although these reforms and reorganizations cannot guarantee better governance, they are the necessary tools. Institutional and structural reforms and improved staffs have provided greater administrative capacity. State governments used these resources to attack new policy issues, share programmatic innovations across the states, increase resources available to local governments, and administer programs more efficiently and effectively. By the end of the 1980s, almost a century of reforms had created a government ready and able to serve its people, and to undergo the most current reform wave—reinventing government.

The 1990s and Beyond: A New Current

The advancement toward performance accountability, privatization, and economy was born of necessity. State governments faced faltering economies, President Reagan's increased devolution of programs, less federal monies, and "cutback management" in the 1970s and 1980s. The net result of these factors was a collective need to do more, do it better, and do it cheaper. The most recent wave of reform in state government seeks to improve governmental performance and responsiveness through strategic planning and budgeting, decentralization of decision making, evaluation, and privatization. Osborne and Gaebler's *Reinventing Government*^[8] is perhaps the most identified source of reform principles within this movement. During the 1990s, the "impact" of programs, administration, and reforms became a leading issue for states. The variety of changes spawned in the previous two decades culminated in this new current of reinvention.

Reinvention is differentiated from previous movements by the types of reform advocated. Dan Durning suggests that two major reform efforts are present in state government today.^[9] One method of reform is the structural reorganizations that have been present for the last 100 years. However, even as states continually reorganize administrative structures, and governors still seek to increase their formal powers, reinventing government is *procedural* and process-oriented. Although governors are implementing both types of reform in the name of efficiency and effectiveness, reinvention is currently the most discussed and debated panacea.

The preeminent aspects of reinvention are “catalytic” government and “steering rather than rowing.”^[8] This calls for government to set the scope and expectations for programs and services and then find the most efficient and effective method for delivery. This especially involves increasing competition in service provision and urges privatization if possible. Additionally, reinvention includes aspects of total quality management, a management philosophy based on a customer orientation, flattening of decision-making hierarchies, and coordination among different units of administration. Each prescription seeks to redefine the processes used to accomplish governmental goals, not make formal structural changes or increase executives’ powers.

Using data from the American State Administrators Project, Brudney, Hebert, and Wright^[10] and Burke and Wright^[11] studied the extent state agency heads reported implementing reinvention initiatives over the last decade. Surveying agency executives in over 90 agencies across all the states, Burke and Wright report that by 1998, the following recommendations had been partially or fully implemented by a majority of state agencies: 1) training programs to improve customer service (83% of agency heads surveyed); 2) strategic planning (87%); 3) quality improvement programs aimed at empowering employees (79%); 4) benchmarking (73%); 5) creation of systems to measure customer satisfaction (64%); and 6) decentralization of decision making (60%). Other reinvention goals, particularly those increasing administrative discretion, were adopted to a lesser extent: 1) reduction in hierarchy (44%); 2) increased discretion in procurement (45%); 3) simplification of human resource rules (34%); and 4) greater discretion to “carry over” funds (23%).

Further evidence of reinventing government is the noticeable movement in states toward privatization or “contracting out.” Burke and Wright^[11] found that almost a quarter of state agency heads reported privatization of major programs within their agency and almost three-fourths reported contracting with other organizations for the delivery of some services. These efforts are improving state government. Over half of administrators polled perceived improved service quality through privatization, while only 9% thought service quality decreased. Both the continuing expansion of “contracting out,” as well as the satisfaction levels indicate that at least some of these programs are improving the effectiveness of state government.^[11]

Another aspect of reinvention is customer/client orientation. Reforms are targeting this goal through training programs to create more responsiveness and mutual respect in administrative transactions with the public. Further, streamlining of paperwork and procedures improves citizens’ interactions with government programs. Citizens are receiving more responsive and

convenient services, often in a shorter time frame (see Osborne and Gaebler,^[8] Goodsell,^[12] for many positive experiences). These changes are at least partly responsible for rising trust in state government. In 1998, over four-fifths of citizens trusted state government to take care of “important business,” an increase in trust from almost every age, race, and educational group. The root cause of this trust, says Andy Kohut of the Pew Center, is the general view that “states have somehow become more competent and responsive to voters’ needs . . . (where previously) state governments were not seen as being progressive or responsible enough.”^[13]

An additional emphasis on state government performance is provided by *Governing* and Syracuse University in the Government Performance Project (GPP). They are exploring and “grading” the quality of five aspects of administration in all 50 states—financial management, capital management, human resources, managing for results, and information technology. In essence, the GPP is an attempt to measure the performance impact of administrative changes and processes utilized by state governments. Many states are doing remarkable jobs in general administration—the top three according to the GPP are Washington, Utah, and Michigan.^[14] Twenty-nine states received grades in the A or B range. However, there is variation across the states. Over a third of the states performed at only an “average” or “acceptable” level (grades in the C range) according to the GPP indicators.

CONCLUSION

This discussion brings us full circle to the question of impact. What has the last century of reform wrought? The Rising Tides of reform movements in the first part of the century brought to the states changing institutions and structures of administration. This early Rising Tide crested into the rapid and widespread reforms of the 1960s, 1970s and 1980s, furthering scientific management principles. The states solidified these orthodox principles with the creation of superdepartments, growing gubernatorial leadership, and more professional personnel. With these structures in place, a new focus on efficiency and, more importantly, effectiveness emerged in the 1990s. Many states still reorganize often, almost with every change in leadership. However, with the focus on performance and accountability that emerged in the 1990s comes the growing recognition that reorganization and reform alone does not “automatically” create a better state government. Even when reform movements do not seem to create better performance and/or governance, a more important feature may simply be the constant calls for

reform that rally state officials to continuously seek efficiency, effectiveness, economy, and equity.^[15]

State Government Adoption of “Managing for Results” Reforms

Donald P. Moynihan

Robert M. La Follette School of Public Affairs, University of Wisconsin-Madison, Madison, Wisconsin, U.S.A.

INTRODUCTION

This article examines the adoption of Managing for Results (MFR) reforms in U.S. state governments. MFR reforms have been adopted in all states, and involve the creation and dissemination of performance information, with the hope that such information will inform public decision-making. MFR has been popular for a variety of reasons, including its power as a political symbol. There is now unprecedented performance information about state governments. At this point, the main challenge for public officials is to find ways to ensure that this information is used.

PERFORMANCE INFORMATION SYSTEMS

For over a decade, the most popular public management reform in the state government has been the adoption of MFR reforms. From the early 1990s state governments embraced the idea of MFR. Of the variety of reforms associated with the reinvention movement, the most widely adopted in state governments were those related to strategic planning, customer service measurement, and performance measurement.^[1] By 2004, all states claimed to have some form of MFR system. Thirty-three states had MFR legislation, and the remaining 17 states had an administrative requirement. Of the 33 states that had adopted MFR requirements, all but three involved legislative changes that occurred after 1993.^[2]

MFR is a combination of strategic planning (systems that set organizational goals), performance measurement (systems that track and provide information on cost and accomplishments of government), and some form of strategic/performance management (systems that shape working relationships and structure discretion in a way consistent with organizational goals).

The standard critique of government bureaucracies is that they are too focused on rules, processes, and inputs rather than results. How can governments require agencies to manage for results? Up to now, state governments have largely limited themselves to

creating formal requirements that push agencies to produce performance information. The result is that state governments have created performance information systems.

The procedural requirements of MFR prompt strategic planning, performance plans, and reports of actual achievements. Typically, agencies are required to develop medium length (3–5 yr) strategic plans and a list of performance objectives and results on an annual or biennial basis. Once agencies generate the performance information, they typically submit it to the central budget office before publication. This is because the majority of states have tied the production of performance information to the budgeting process. As with other parts of the budget, the central budget office provides guidance on how performance information will be reported, including definitions and formats that agencies must adhere to.

The basic logic of MFR is illustrated in Fig. 1. The model assumes that MFR is a continuous system, where strategic planning creates goals and objectives, performance measurement tracks the achievement of these goals, and this information feeds into a variety of decision-making venues, which in turn will affect strategic choices to be made. Evidence from American state governments suggests wide acceptance (if not always actual implementation) of this model. States frequently refer to performance management systems, emphasizing that strategic planning and performance measurement are connected processes, and intended to affect decision-making, particularly budget and management decisions.^[3]

The Government Performance Project graded the quality of MFR efforts in all states in 1999 and 2001, and in 2005 graded both MFR efforts and aspects of information technology in a revised category called information. Table 1 provides these grades, and more detailed information can be found online at <http://results.gponline.org/>.

WHY IS MFR SO POPULAR?

There are a variety of possible reasons why MFR has become so popular in state governments. One is that

Fig. 1 An MFR system: integrating planning, measurement, and decision venues.

state governments have adopted such reforms because of budget deficits and are looking for a basis to cut programs. However, MFR reforms were mostly adopted during a period of unprecedented prosperity.

Another explanation is that adoption followed a pattern of institutional isomorphism,^[4] meaning that as soon as MFR was adopted among some pioneers and deemed to be a success, other states viewed it as important to their professional legitimacy and also adopted it. There is some circumstantial support for this theory. Along with some early adopters such as the state of Oregon, the most visible pioneer of MFR was at the federal level, which passed the Government Performance and Results Act in 1993. Many states took the federal model as a validation of performance management, and a model to emulate. MFR was actively disseminated and promoted by professional public administration organizations and other good government groups, such as the Governmental Accounting Standards Board, the National Academy of Public Administration, the National Council of State Legislatures, the International City/County Managers Association, and the Urban Institute. The effect was to make MFR increasingly important to the professional legitimacy of governments. Federal program requirements and bond agencies also encouraged the adoption of MFR. Some federal programs tie state funding to performance reporting, while bond agencies include performance information as a criterion for rating the credit-worthiness of a government project.

Elected officials were involved in the adoption process of MFR and so political considerations must be taken into account. As legislatures adopted MFR reforms, they largely neglected related reinvention proposals designed to liberate managers from

constraints on the use of financial and human resources.^[5] Why? If we assume that elected officials look at the political costs and benefits of reforms, MFR is politically attractive because it communicates values to the public.^[6] The public sees that elected officials share their frustration with bureaucratic inefficiency, but have a rational plan to make government more effective and hold bureaucrats accountable for results. Such a reform proposal is difficult to resist. By interpreting MFR narrowly to mean performance information systems, elected officials limited political opposition. If they had decided to pursue broader reforms that included reorganizing personnel authority and eliminating traditional financial controls, this would have been a more contentious political battle, with strong opposition from public employee unions.

IMPLEMENTATION OF MFR

There remain numerous barriers to MFR implementation, including:

- Ensuring that performance data are timely and relevant
- Ensuring that lower level objectives and measures are consistent with strategic goals
- Ensuring that data are valid and reliable

Such barriers, while real, are technical in nature. Adequate resources, administrative energy, and information technology can overcome them. Central agencies are becoming better at identifying standards for reporting information, and agencies are becoming better at collecting performance information and undertaking strategic planning. States have increasingly devoted resources to performance auditing. Usually a part of the legislative branch, the performance auditors verify the reliability of the data that agencies report. States have also reduced the costs and increased the speed in collecting and disseminating performance

data by using the Internet, a good example of which is the Virginia Results website: <http://www.dpb.virginia.gov/VAResults>.

This progress means that states have become competent at the first two steps in the MFR system illustrated in Fig. 1: strategic planning and performance measurement. They have also increased their capacity to disseminate performance information, meaning it is usually available for decision-makers who are interested in it. Where state governments have struggled with MFR is in making sure that performance information actually shapes decisions.

Ensuring performance information use is the most difficult part of MFR, but also the most consequential. After all, what good are performance information systems if no one pays attention to them? The challenge for fostering performance information use is not primarily a problem solved by technical solutions. It requires changing ingrained patterns of decision-making that people are used to and comfortable with, which in turn requires changing organizational cultures and incentives. Because MFR has been largely associated with the creation of performance information systems, rather than as a package of more widespread organizational reforms, the likelihood of fostering such comprehensive changes is low.

Examples of state governments using performance information to make smart choices do exist.^[7] But such evidence appears to be anecdotal, and there is little evidence that this information is being used among governmentwide decision-makers in the governor's office or in the legislature. The most frequent use of performance information is to inform strategic planning, and to simply report the information to other actors.^[2]

Perhaps the expectations for MFR are too high. The enthusiasm to adopt such reforms was characterized by some unrealistic expectations about how performance information would change decision-making. Actual experience with MFR has tempered expectations. A more pragmatic goal is that performance information should inform, though not dominate, the dialogue that leads to decisions.^[8] Other factors, including political considerations, cannot, and should not be sidelined, because governmental decision-making is at heart a political process.

If we accept this view of MFR, we can begin to understand how performance information is used in the context of a dialogue between different actors. The actors involved will have different perspectives, which will influence what performance information they collect and highlight, and how they interpret and explain performance information to others. Agencies can be expected to use performance information to defend their policies and management, and press for

more resources. Central agencies will attempt to use performance information to monitor agency performance, police budget requests, and ensure consistency with the governor's policies. The legislature will use performance information to maintain oversight on the executive branch.

This difference in perspectives is wide enough that actors from different institutions are likely to disagree on the basic purposes of MFR and the problems it faces. A practical illustration of these different perspectives comes from a survey of state budgeters and managers.^[2] Budgeters perceived that the major problem for MFR is that managers and elected officials are not using the information, and that performance information does not carry enough weight in budget decisions. Managers were significantly less likely to see these as problems. Instead, they emphasized the problems associated with data collection, because they carry the reporting burden. Managers also pointed to outside factors affecting measurement, reflecting a concern about being held accountable for factors they felt they did not control. Both managers and budgeters perceived inconsistency between the performance measurement database and the accounting/budgeting database as being a major problem. This sounds like a technical problem, but partly reflects the different preferences of the executive and legislature. Managers in the executive branch create a performance management database that links to programs, while budgeters in the legislature are used to traditional account structures that may define programs in different ways. Neither side wants to change the structure for organizing programs that makes sense to them, which makes the process of aligning performance information with budget decisions that much more difficult.

While MFR was largely premised on the promise of better decision-making and greater government accountability, it is also worth considering some of the unanticipated benefits. MFR can be used as a lever to change organizational culture and motivate employees, improve internal and external communication, and foster organizational learning.^[2] These changes may not immediately and measurably improve performance, but they do enhance organizational capacity, and in the long run can be expected to improve organizational performance.

The uses of MFR tend to occur largely at the agency level, where there is less likelihood of performance data becoming a matter of political disagreement. Agency leadership plays a key role in determining whether an agency actively uses MFR for management, or simply complies with reporting requirements. When choosing whether to actively promote MFR or not, agency leaders will be guided by a consideration of the constraints and opportunities faced by their agency, as well as their own vision for

the future. If MFR furthers the vision of the agency within the constraints faced, they embrace it. If they viewed MFR as simply a reporting requirement that is likely to make little real difference to management or resources, leaders ensure pro forma implementation and little else.^[6]

CONCLUSIONS

A cynic might compare state government experience with MFR as akin to a hamster on a running wheel. The hamster is diligently trotting along, but appears to be going nowhere fast. This characterization is somewhat unfair, but contains a kernel of truth. State governments have become increasingly skillful at collecting and disseminating performance information. There is, to be sure, a wide variation in the quality of the information produced between states, and there is occasional backsliding within states. But all states are better off than they were a decade ago, and collectively, there has never been as much performance information of such good quality and as widely available as there is today. This, surely, is progress.

On the other hand, state governments are still struggling to reap the benefits of this performance information. Simply because the supply of performance information has improved, it does not mean that there is a strong demand for it, or that managers have changed their patterns of decision-making. This is the most difficult part of MFR, but also the part that will ultimately define whether a decade of reform was actually worthwhile.

State Government Policy Initiatives: Improving Access for the Medically Underserved

Mary Schmeida

Department of Nursing Research and Innovation, Cleveland Clinic, Cleveland, Ohio, U.S.A.

INTRODUCTION

This article discusses healthcare access barriers and state action for improving services to the medically underserved. Geographic isolation from health centers, lack of health insurance, and workforce shortage are major barriers. Many factors interact, making no single policy the only answer to the issue. Under fiscal constraint, states have been passing a patchwork of laws bridging the disparities between populations with and without healthcare access. We define the medically underserved community as rural or urban with professional shortages and/or populations with socioeconomic or demographic barriers to healthcare. Most underserved populations include rural residents, the minority, the elderly, emergency care recipients, and Medicaid eligible—poor, disabled, and children.

MEDICALLY UNDERSERVED POPULATIONS

History shows a growing maldistribution of physician specialists and health services in non-urban areas. Most graduating physicians choose to practice in areas with more clientele, higher incomes to offset school loans, and accessibility to advanced diagnostics. As a result, rural areas are at a disadvantage for care, as residents must travel a distance to see a physician or dentist. The most rural, poorest, and elderly of the states usually have a lower supply of physicians. This translates to better clinical outcomes for urbanites as metropolitan residents report fewer diseases. However, urban isolation affects many elderly and the chronically ill population. In fear of the external environment, the frail often choose to isolate despite proximity to specialists.

Healthcare for rural women and newborn is a concern. Rural counties have a higher rate of complicated pregnancies and infant mortality. Prevention of disease and early medical intervention can save lives, but is difficult for mothers living at a distance and lacking insurance. Also, rural vehicular death rates are higher owing to treacherous terrain, and lagged response time from distant emergency crews. Rural emergency care

recipients are disadvantaged as issues of personnel recruitment and retention, and funding challenge this needed public service.

Minorities have largely been medically underserved. Poorer health outcomes are seen in heart disease, stroke, cancer, diabetes, and kidney disease, with African-Americans leading other groups. Asian and Pacific Islanders lead in stomach cancer death, while Native Americans and Alaskan Natives have higher suicide rates. More Hispanic adults lack a usual place for health service than non-Hispanic black and white adults.^[1] Many health professionals lack cultural sensitivity training important for accurate medical evaluation and the treatment of ethnic/racial populations.

Barriers to Healthcare Access

Physician and nurse workforce shortage, lack of healthcare insurance, and geographic distance are primary barriers to healthcare. In 2001, Nevada, California, Texas, Utah, Idaho, Oklahoma, Arizona, and New Mexico had the lowest rate of active non-federal nurses. In 2002, active physician rate was lowest in rural and poorer states led by Idaho, Oklahoma, Mississippi, Nevada, and Wyoming. As resident population decreases so does the supply of physician specialists.^[2]

Professional workforce shortage

States are experiencing a shortage of medical professionals in non-metropolitan areas. In 2003, for example, primary care shortages in rural areas—especially for general physicians, pediatricians, and internists—were greatest in California, Arizona, and Pennsylvania.^[3] Access to mental health professionals is more limited outside urban settings, and shortage is greatest in Michigan and Kansas. Dentist shortages are also highest in rural areas.^[4] Conditions are likely to worsen; professional school enrollment in both fields lags retirement rates. Shortages of nurses are evident throughout the healthcare system. Hospital restructuring, reduced job satisfaction, and retirement (by 2010, some 40% of nurses will be aged 50 and over) are contributing factors.^[5] As the “baby boom” age

cohort retires, the consequences of the several health-care workforce shortages will be increasingly complex.

Lack of insurance

The lack of health insurance is a barrier to healthcare services. Healthcare costs are exceedingly expensive. People without health insurance (private or federal) or ability to pay for services do not have access to the healthcare system. Racial/ethnic minorities, the impoverished, and jobless commonly lack insurance or ability to pay for access. In 1990–2002, lack of insurance was greatest for people aged 18–24 yr and least for people aged 65 and older. In 2002–2003, people living inside central cities of Texas, New Mexico, and California had the greatest uninsured rate across the nation.^[6]

Many people with private health insurance also face healthcare access problems. Some health insurance plans are not adequate to meet the healthcare needs of the insured person. For example, some health plans will pay for preventative healthcare, but do not cover expenses for pre-existing medical conditions, leaving people underinsured for their chronic illnesses. Better health plans are available but with costly premiums.

State Government Policy Initiatives

Improving healthcare access is a priority for state policymakers and initiatives. States are responding to professional shortages using incentives to recruit and train professionals, improving insurance access through Medicaid waivers and private insurance regulations, and building statewide emergency medical systems (EMS). Telehealth cooperatives across states and institutions are bringing health services to rural and urban isolates through advanced technology.

Telehealth programs

Telehealth programs can improve health services to the medically underserved. Through advanced communication technology, providers at urban health centers can connect with needy patients at a distance. Persons can remain at home in their community and receive services even though the nearest specialists are miles away. Expensive start-up costs have led state agencies, private sector organizations, university, and medical institutions to pool resources and form cooperatives across states and regions, with some participating in international cooperatives. Programs are quickly growing in scope and considered cost-effective alternatives to professional shortages.

Considered a leader, California is participating in many telehealth initiatives. The “doc in the box”

program administered by the Department of Mental Health Riverside County has ranked first in mental healthcare across the states. It bridges the gap between emergency room services in urban and semiurban areas through televideo and phone. Funded through a state grant/contract with California, the Lake County telepsychiatry program is targeted at youth. The Telehealth Idaho research project provides both mental and dental rural healthcare services. Dentists can digitize and electronically transmit X-rays and still images, videoconference with distant specialists, and electronically expand the capacity of mobile dental clinics. The Kentucky Telehealth Network administered by local academic medical centers digitally connects rural public school clinics to primary care centers and institutions to service children with special needs. Telehealth can provide support to the chronically ill needing home healthcare to prevent hospital readmission.^[7]

State lawmakers are creating the legal environment for telehealth expansion by enacting a patchwork of enabling laws. Physician and nurse telehealth licensure regulations protect professionals from liability risks and govern practice. Health information privacy laws protect sensitive health information as it is accessed and transferred by professionals in patient management. Medicaid telehealth reimbursement laws expand professional interests to use telehealth for servicing the poor and disabled populations. Both Medicaid and Medicare policy have expanded eligibility for telehealth practice to allied health professionals.

Workforce recruitment and training

Financial incentives, such as school loan repayment and subsidies have been effective intergovernmental policies in recruiting professionals to work in underserved areas. Housed in the federal Bureau of Health Professions, the National Health Service Corps assists states to recruit primary care, mental health, dental, and nurse professionals into underserved areas through school loan repayment and scholarship assistance. Through a matching grant, states operate individual loan repayment programs. Michigan has a large State Loan Repayment Program aiding in the recruitment and workforce retention in professional shortage areas. Some recruiting programs are web-based, such as Med Job Louisiana, and target professionals of diverse populations to meet the needs of minority groups.

As with recruitment, training programs aim toward cross-cultural competence. Culturally sensitive professionals are able to respond to ethnic/racial concerns and contextual differences, important for accurate illness diagnosis and case management. This includes effective treatment of the rural culture, socioeconomically distinct from the urban. Also, training professionals

to practice several areas of medicine is a cost-effective solution. Cross-training the primary care physician about mental health diversifies those choosing to practice in professional shortage areas.^[8] Other state policy attracting physicians and nurses to underserved areas include subsidies for relocation start-up costs and the accompanying premiums, income tax credits, and out-of-state guest licenses.

In addition to loan forgiveness programs and recruitment campaigns, fixing the nurse shortage has been challenging. States and professional groups have focused on improving long-standing work condition problems by providing measures, such as safer work environment and patient workload, better compensation for overtime work, flexible schedules, and expanding the role of the nurse. As a response to their extreme nurse shortage, the California Nursing Education Initiative is building public-private collaborative relationships to improve the capacity of California's nursing education system^[9] as is more state funding.

State health insurance initiatives

State health insurance initiatives include Medicaid waivers and private insurance regulations. The majority is reforming insurance coverage through Medicaid reform initiatives and has a Medicaid system created under a waiver. These include grants, collaboration with other government and private agencies, premium cost sharing, and beneficiary empowerment. Using managed care arrangements, California proposed Medicaid expansions to include previously uninsured groups. These arrangements build program capacity creating efficiency, improving service management and enrollment. Other initiatives include beneficiary cost sharing of premiums. New Mexico's *Mi Via* Program initiative empowers beneficiaries through privatization. The state allocates a budgeted amount for healthcare spending to beneficiaries, giving them discretion in choice and control over their own services, instead of government making the consumer choices. Traditionally underserved populations including the elderly and mentally ill are eligible.^[10] In Louisiana's 2005 healthcare reform package communities can leverage local funds so as to use pooled funds for health needs.^[11] Some states have made collaborative arrangements with other public agencies to promote efficiency and better target services. Noted for best practice, Maryland's interdependent arrangement between the Medicaid and State Mental Health agencies has improved access to community behavioral services, decentralizing decision-making authority on day-to-day operations. New Jersey's collaborative arrangement between Medicaid and several human service divisions is also recognized for best practice in improving access to mental healthcare.^[12] However,

at times of fiscal stress, some states have reduced Medicaid benefits and applied eligibility restrictions even though enrollment has increased for the State Children's Health Insurance Program.

The states are also regulating the private insurance industry with a variety of laws to improve access to health benefits. Parity laws have become common. Commercial employers offering employee health benefits must provide insurance parity or equitable insurance coverage between medical disease treatment and treatment for mental illness and drug addiction. In the past, higher capitation rates for medical treatment left some with mental illness and addiction spending down to qualify for Medicaid benefits. Some states, however, have only passed watered-down versions of these regulations with loopholes for commercial employers. As states are looking to private insurance as one answer to improving access, some are mandating the private market as the primary insurance coverage followed by public insurance. Experiencing Medicaid budget constraints, promoting the use of private insurance first is gaining appeal in poorer states. Others are requiring insurance carriers to sell insurance to everyone applying for benefits despite their age and health status, and to make premiums more equitable across age groups, gender, and health conditions. Policies on refundable tax credits for health insurance for those covered by employer or private non-employer health plans are in debate.

Building statewide EMS

State officials are responding to federal pressure, morbidity and mortality rates, and citizen demand for statewide EMS that work. A continuum of laws has been passed with the majority funding EMS personnel recruitment programs, equipment, manpower training, transportation, communication technology, and public safety programs. As a venue for change, the state offices of rural health are catalysts in reforming the rural healthcare system, such as emergency care, managing interests and funding opportunities, diffusing policy ideas interstate and intrastate.^[13]

Building communication capacity between clinicians and EMS personnel is essential, and tele-emergency care will become more common. Early communication between emergency technicians with physician specialists located at hospital sites can improve clinical outcomes for injuries requiring quick medical intervention, such as stroke and heart attack. Advanced technology has the potential to improve rural and urban emergency treatment. Recognized as a best practice, Chicago's Fire Department is equipped with medical reporting technology as hand-held notepads improve early communication with emergency room personnel to save time and lives.^[14] Building the

information infrastructure is a nationwide effort and responsibility is shared among levels of government and the information industry. Given current terrorist issues, building effective EMS is a priority for disaster preparedness and response, a citizen concern. Stakeholders on the state–local level are voicing their values on emergency preparedness to state and national officials hoping to encourage policy development.

State Government, Aspects of Managing Strategic Change in

Paul C. Nutt

Fisher College of Business, Ohio State University, Columbus, Ohio, U.S.A.

Jeffrey A. Rosen

Gregory Paxton

School of Public Policy and Management, Ohio State University, Columbus, Ohio, U.S.A.

INTRODUCTION

Agencies and departments of state government are faced with many new demands that call for changes in their missions.^[1,2] The unique needs of public agencies^[3,4] require leaders to think about managing processes of change in ways that differ from those approaches used in the private sector. Under the current political climate, change in state government agencies will be continual, and agency leaders must be prepared to incorporate the flow of new demands. Managing such a process of change in a public agency can be a daunting task. This article builds on the strategic change concepts developed by Nutt and Backoff^[5] and shows conditions under which leaders can initiate the process of strategic change in a state agency along with some of the required moves. First described are the types of agencies that exist in today's public environment emphasizing the conditions that influence an agency's prospects for undergoing change. Then discussed are several strategies that fit agency types susceptible to change.

MANAGING THE CHANGE PROCESS

Managing a process of change requires state agency leaders to make several crucial moves. Among the first is to determine the agency's prospects for change. Once this has been done, the leader matches a proposed strategy with the expected agency environment. Leaders are offered some thoughts on how to do this.

Agency Positioning and the Prospects of Change

Many leaders of state agencies find themselves in situations of limited capacity and/or low responsiveness to expectations.^[6] Capacity has been eroded by years of budget cutting, limitations on prerogatives from court rulings, rule making by legislatures, assignment of

duties to other agencies during reorganization and chronic staff turnover. As capacity reaches a low ebb, complacency may set in, making change difficult. Demands are experienced at a rate that exceeds the agency's ability to understand the proposed actions or requests. Such an agency may have been reacting with a learned helplessness posture, in which elaborate rationales for avoiding action supplant building capacities.

Fig. 1 shows how state agencies can be classified according to their capacity and the extent to which prerogatives are dictated by outsiders, such as legislatures. Strategic change attempts to move a state agency toward increased capacities and increased control over their environment. This section discusses how state agencies get in such situations along with when it is possible to move agencies toward change. This is shown by moving up the diagonal, running from lower left to upper right, as indicated by the arrows in Fig. 1. The path along the diagonal toward a more proactive posture identifies conditions that make change feasible. When there is an imbalance between external control over actions and internal capacity, strategic change is apt to be blocked. A balance between control and responsiveness is required to make strategic change seem possible.

Agencies that Resist Change

Agencies have little motivation to change when internal competence and external control are seriously imbalanced. When either competence or control dominates, attention is focused on maintenance of competence and control and not on using competence to exercise useful control. Such agencies get located far off the diagonal describing the path of change in Fig. 1.

Professional agencies

Agencies that have high internal capacity, real or perceived by outsiders, with little external control are called professional. Activity is directed internally by

Fig. 1 Forces prompting change in state agencies.

professional values. Control is low because the political, legal, and economic structures that ordinarily direct and channel energies and ensure accountability are not in place. Typically, such an agency has protected its budget or resource base and its prerogative to act within a prescribed arena. State departments of taxation and the attorney general's office provide examples. Such agencies rely on highly skilled and self-regulated staff members to provide what professionals deem to be the proper response for classes of problems and issues. Other examples include state run mental health and acute care hospitals, university facilities, social work agencies, and any other agency dominated by a professional elite that controls the terms of services that are provided. Strategic change with professionals who seek to maintain this kind of control is not apt to be successful. The professional bureau or agency can ignore client or stakeholder preferences, the political agenda of reformers, and public support and may even be insulated from budget cutting. In some instances, the professional agency can even turn aside legal mandates and judicial orders. Such agencies have little motivation to change.

Protected agencies

Agencies that lack internal capacity but have a clear cut domain of action are termed "protected." Such an agency has exploited its leverage with a power elite to carve out a domain over which it has an exclusive right to act. Legislation may even be written to give exclusive rights or responsibilities. Protected agencies then take rigid control of the domains. The Iowa Legislature gave the University of Iowa Medical School exclusive rights to provide all tertiary care in the state. In a protected agency, old-boy networks that connect the agency to a power elite are carefully maintained. The network is used in this way to deflect

criticism and routine accountability and to harness the forces that would normally be used to monitor actions. Departments of development (DOD) are often viewed as essential by Republican legislatures and governors. Such an agency can be expected to carefully maintain such a network to harness forces that would normally call for accountability. When a critic asks how many new jobs have been created by a DOD and how much tax base has been given away, the network is mobilized to deflect the critic's questions or make them seem unwarranted or politically motivated. Control of turf in this way by agencies creates little incentive to improve capacity and makes the agency quite political.

Routinized agencies

Agencies low in competence and capacity quickly become routinized. To justify their existence, highly codified routines are developed and rigidly followed. If no one questions what such an agency produces, the agency can go about its processing with very little accountability. Examples include state highway patrols, contract activities in departments of transportation, claim processing in bureaus of worker compensation, and service departments such as travel, records and transcripts, and stores in universities. Without leverage, a critic gets nowhere because little is expected of the agency and even less has been provided to facilitate its mission. Former students who complain about poor service, such as delays in getting a transcript, are ignored by university leaders and oversight bodies that have more important things to do. Delays in receiving compensation benefits fall on deaf ears, charges of unfair or unethical contracting for highways are ignored, and questions about how the highway patrol spends the bulk of its budget go unanswered. In each case, oversight bodies have little motivation to question long-standing practices.

The Forces for Change

The protected, professional, or routinized agency can be pushed toward change by loss of control and/or a loss in capacity. When this occurs these agencies become buffeted and begin to field pressure to change. This movement can occur in three ways as shown by the arrows in Fig. 1.

Change for a professional agency

Strategic change in a professional agency is difficult even when forces calling for more control over the agency's actions are clear and compelling, unless the agency's capacity is thought to be declining. Such an agency is moved toward the diagonal in Fig. 1. If perceived competence falls perceptibly, such a drop will make strategic change both possible and desirable. For example, the FBI's reputation at the death of J. Edgar Hoover went into eclipse forcing the FBI to become more concerned about public relations and to reexamine its role. The strategy of a professional agency rests on maintaining its internal capacity. So a decline in competence (real or perceived) is a necessary precursor for change to occur in professional agencies prompting them to attempt to maintain an image of competency when new practices are being forged and adopted. If real or perceived competence declines, such an agency requires new positioning. Defending past practices coupled with small adaptations is carried out. The IRS, stung by reports that they unmercifully harassed tax payers, confiscated the bank accounts of children, and gave inaccurate tax advice, mounted strategy to do damage control and reform its procedures.

Change for a protected agency

Agencies that cultivate patrons and ignore building capacity end up in the upper left corner of Fig. 1. The strategy in such an agency is to maintain the old-boy network and other arrangements that protect turf. Real change is not apt to occur unless these arrangements erode. Erosion of turf or prerogatives can occur when agency patrons lose elections, leave office, or when an old-boy network ceases to function. This shift pushes the protected agency into the mainstream. The political agenda of newcomers or a shift in power among stakeholders signals the need for action. The clear and compelling call for better services and the like can no longer be ignored. To respond, the agency must increase its internal capacity, shifting it toward the diagonal in Fig. 1.

After a new governor took office, Ohio's Department of Public Welfare experienced such a shift, moving from a protected position to one of increased

expectations. The status quo was no longer acceptable and the need to change was accepted. The welfare department had to abandon a strategy in which clients were expected to respond as directed and move toward a posture that emphasized helping clients, which provided the impetus for strategic change. Increased awareness of low internal capacity often accompanies shifts in environmental control. Exposing this low capacity invariably forces rapid action to improve matters, increasing the need for and desirability of strategic change. Leadership transitions and increased consensus to adopt a new proactive stance often result.

Change for a routinized agency

State agencies with modest to low competence can be ignored for decades. Oversight bodies place few demands on them, so they go about their actives with little accountability until there is a shift in expectations for either competency or control or both. For instance, complaints about long waits and inept staff prompted change in a state bureau of motor vehicles. New funds were provided and new systems were designed to allow mail-in license plates renewals that separated taxpayers and staff, thereby reducing both dysfunctional contacts with the public and the time involved. Note how complaints had to become intense before action was taken that recognized the need to increase competence (new systems). Such attention is necessary, but sometimes not sufficient to move an agency out of its routine posture. The state bureau of motor vehicles soon reverted to its bureaucratic ways when funds to go beyond the mail-in license renewal program were cut off by a new administration. Bureaucratic routines arose to carry out the mail-in license renewals program that recognizes only clearcut mailings and tolerated no exceptions.

Promoting Change

Agencies on the diagonal in Fig. 1 are put into an unstable state when internal capacity and external control are more balanced. When a question about whether the organization's directions have or can produce hoped for outcomes is posed externally through the preferences of stakeholders, shifts in political agendas, erosion of public support, budget shortfalls or windfalls, or legal rulings, the agency is prodded into action. Such a prodding can also arise internally when there is a shift in consensus or changes in leadership. Internal and external prodding for agency transformation then make strategic change seem pragmatic and lower barriers to change erected by political or professional postures. Two new agency types are created: the buffeted and the proactive.

The buffeted agency

When a professional, protected, or routinized agency experiences a sustained erosion of competence and/or increased control, it becomes buffeted. The buffeted agency can get pulled about by fickle public support, changing legal mandates, shifting political agendas, and shifting preferences of clients or key benefactors. As mandates shift, budget support may shrink and constraints about the use of resources emerge. As a result, shifting priorities provide moving targets that can lead to frustrated staff and turnover of key personnel. Turnover forces large investments in training that further bleed away resources. But agencies experiencing such buffeting are susceptible to change.

A process of strategic change can help the buffeted agency come to grips with the forces at work in its environment. Capacity to act can be gradually built by finding ways to increase the agency's control over its environment, which in turn, can lead to both a happier and more challenged staff and can also reduce turnover. As capacity is built and environmental control established, the agency develops an increased awareness of the need for strategic change.

The proactive agency

Demands for high internal capacity balanced with high external responsiveness and the obligations inherent in this responsiveness creates a proactive agency. An agency in such a posture develops a shared understanding of needs and potential to act. Consider the Ohio Department of Natural Resources (DNR), which moved toward a proactive organization with high environmental responsiveness by strategic management. Key stakeholders who had expressed criticisms were folded into task forces to deal with important issues such as wildlife protection, natural areas, hunting and fishing rights, waterways, and recreation. Programs were identified and funds sought to operate them through licensing the use of wild areas, through park programs, and through new types of fishing and hunting licenses. The fees collected were turned back to fund program development, which produced more fee generating activities until two-thirds of the DNR's funding was outside the state's budget process. By responding to stakeholders in this way, the DNR became a self-sustaining proactive agency that is highly responsive to stakeholders, as well as high in action.

MATCHING STRATEGY TYPES TO AGENCY ENVIRONMENTS

Agency leaders managing a change process must identify their environment and match to them an

appropriate strategy. Needs and responsiveness to needs, which describe the environment in which all state agencies must operate, are often "socially constructed." They get fashioned by agency leaders and oversight bodies around beliefs about what people need and the extent to which an agency should respond to these needs. The agency leader or its oversight body may see these needs and their ability to respond to them realistically, or they may misrepresent them.^[7] Change is difficult when an agency leader wants to be more proactive than his or her oversight body sees as being appropriate or necessary or when the oversight body calls for acting on low priority or non-existent needs. Both situations create unstable states that cause agency leaders difficulty and will ultimately derail any change effort. When this occurs, the agency leader has several strategic choices. Within each enacted environment there are two strategic moves possible, one superior to the other.^[8-10]

Fig. 2 depicts the environments in which state agencies operate. Fig. 3 illustrates how state agencies can shape their strategy to fit their environment, indicating both effective and ineffective strategies. An agency's *responsiveness* to perceived pressures for action creates the environment in which they operate. *Need volatility* creates a loss of control, as the needs of the clients being served become difficult to predict and can increase with little warning. The lower left corner of Fig. 3 depicts an agency that is functioning without producing much useful action. The aim is to move such an organization as far as possible up the diagonal from lower left to upper right, gradually making it more proactive in responsiveness to emerging needs and fashioning arrangements to meet these needs. Instead of merely responding, a state agency can alter its relationship with other agencies and stakeholders that make up their environment. The expected level of responsiveness is modified as the organization makes these commitments. This can prompt a leader to adopt a *director*, *bureaucrat*, *accommodator*, or *compromiser* strategy.

Agencies that respond as if needs are at a low ebb are in a *placid* environment. A *drifter* strategy, a likely result of this environment, is often adopted by professional agencies in which goldbricking is widespread.

Fig. 2 Environmental types.

Fig. 3 Agency strategies.

A *bureaucratic* strategy moves such an agency to a minimally acceptable posture. An agency with this strategy takes a defensive posture to protect seemingly important practices through budget maximization and the creation of slack for inevitable budget cutbacks. The equivalent of protectionism in firms is sought. Agencies with high responsiveness to low demands for action prompt a *clustered placid* environment. Such agencies often adopt a *posturer* strategy where issues are brought to the attention of others for action. State agencies that bring problems to the state legislature for decision making display some of these attributes. For instance, the new head of the Ohio Bureau of Workers Compensation (BWC) posed questions about the adequacy of agency reserves and called for increased funding to bring them up. Legislators saw the request as a call for higher fees and/or more tax support, which was seen as irresponsible. The legislature had commitments to firms to keep fees low and to the electorate to keep a lid on taxes. The BWC leader was told to bring solutions, not problems, to the legislature in the future. A more effective approach applies an *accommodator* strategy to deal with each cluster by recognizing and dealing with the emergent and unique needs in each cluster. Priorities must be set to allocate available funds among the clusters based on the compelling nature of the needs in each cluster. Allocation is carried out in conference, where moves are made to create opportunities to make subsequent moves. This tactic is used in budget hearings, media reports, and the like to gradually reveal allocations and read reactions.

Disturbed environments arise when responsiveness has been low and the need for action abruptly increases. Agencies that deal with emerging needs with little or no new responses create a *dominator* strategy. The motivation here is to maintain discretion in the choice of action and divorce it from accountability. State departments of taxation use such a strategy. A better approach calls for the *director* strategy, in which new demands are dealt with by taking measured

action. Turbulent environments arise when responsiveness and the need for action both increase dramatically. This often prompts the *compromiser* strategy. The agency plays one constituency against another, meeting the needs of important constituents, needy constituents, or both when resources permit. Such a strategy was adopted by the BWC to prompt internal process changes that increased the speed of claims processing and reduced costs to allow employer fees to fall. A *mutualist* strategy is a better approach because it attempts to create collaborative arrangements to meet all the important needs that arise with umbrella organizations.

Mutualist strategy calls for novel arrangements to be created to meet emergent needs. A *mutualist* strategy calls for: 1) leaders to set the tone by subordinating personal and organizational interests; 2) a consortium that draws together the key stakeholders into an umbrella organization to address priority issues; 3) creating or shaping a vision to meet emergent needs; 4) seeking win-win arrangements for affected parties; and 5) promoting trust so stakeholders will cooperate toward resolving the issue, thereby guiding stakeholders away from competition and toward cooperation.^[5]

A *mutualist* strategy takes shape as a quest, which proposes new initiatives to create a grand vision. A *mutualist* strategy calls on stakeholders to search for new ways to deal with unseen realities and entices key people to collaborate in meeting the needs that prove to be crucial. To create major shifts in competence, the buffeted agency must move toward the *mutualist* strategy.

Strategy is used by an agency to focus effort into reaching for its visions or ideals by providing plans, ploys, positions, and perspectives.^[11] As a plan, a strategy offers a way to take action, such as finding new clients and services. Ploys are strategies invented to deceive an opponent. Note how ploys are not useful in *mutualist* strategy, but are essential to a *compromiser* strategy. Strategy as position seeks services that seem needed by reading environmental signals. Positioning, such as protecting budgets or becoming territorial by staking out a service area, often accompanies the *director* and *accommodator* strategies. As a perspective, strategy captures an organization's traditions and commitments, becoming a touchstone for future action.

CONCLUSION

When trying to introduce change into the public sector, strategic leaders face many daunting challenges. To improve the prospects of success, leaders must both understand the environment under which the agency

operates and be able to recognize situations in which change is feasible. Once a leader understands the agency's environment, leaders then can select a strategy that allows the agency to realize the most pervasive change possible. In this article, agency leaders have been provided descriptions of the various types of environments that exist in the public sector. Some of the needed steps have been laid out to match strategies to agency environments, denoting strategies that fit and those that have the best prospects of making meaningful changes. It is clear that the current political environment necessitates the changing of public agency missions and practices. The concepts described will hopefully offer agency leaders one way to think about the process of change.

State Government: Complex Policy Network Management

Kathleen Hale

Department of Political Science, Auburn University, Auburn, Alabama, U.S.A.

INTRODUCTION

Complex policy networks are unique organizational arrangements in which public and private organizations work together to accomplish effective, coordinated action in furtherance of public policy objectives. These networks represent a distinct organizational response to the pressures of devolution and government reform. Complex policy networks extend the boundaries of intergovernmental relations beyond the public sector and incorporate private sector actors, most frequently non-profit organizations. As organizational arrangements that exist outside the traditional hierarchical authority and communication relationships of public agencies, complex policy networks place new demands on the skills and resources of public managers. Examples can be found across public policy domains; the strong local character of education and criminal justice administration reinforce the management complexities experienced in state governments. More broadly, complex policy networks present challenges to state governing authority and capacity in the public policy process.

NETWORKS AS UNIQUE ORGANIZATIONAL ARRANGEMENTS

The concept of complex policy networks has evolved through the study of networked arrangements in public policy implementation, their consequences for public administration and the impact on public management practices. Networks in policy implementation are understood as structures of interdependence involving multiple organizations or parts of organizations in which one unit is not simply the formal subordinate of another unit within the context of a larger, hierarchical arrangement.^[1] A complex policy network can be distinguished from other organizational arrangements in the lack of formal hierarchy and the lack of congruence of organizational mission among constituents.

In the context of state government, complex policy networks present cross-sectoral arrangements that include all or part of one or more public agencies and all or part of one or more private, typically non-profit, organizations. As such, complex policy networks

include the distinct characteristics of both public and private non-profit organizations. Vertical lines of authority and elected or other forms of representative governance coexist with volunteer boards of directors and community volunteers, each in pursuit of distinct organizational missions. A host of vertical, horizontal, formal and informal lines of authority transmit communication, spread responsibility and diffuse authority.

In complex policy networks, public policy objectives are shared in whole or in part by constituent organizations. Similarly, separate policy implementation frameworks are conceptualized for the network as a whole. Policy outcomes exist for the organizations in the network, the network itself, and the broader policy communities and political environments that touch the network.^[2]

EVOLUTION IN AN ENVIRONMENT OF INTERGOVERNMENTAL REFORM

Complex policy networks evolved over the past several decades against a backdrop of shifting pressures on intergovernmental relationships. Inflationary pressures on real estate and property taxes throughout the 1970s and 1980s fostered successful citizen campaigns to limit state taxes and state spending. During the 1980s and 1990s, studies of government inefficiency gained national prominence. The Grace Commission in 1984 reported that tremendous savings in public expenditures could be realized through private sector contracting and revised procurement protocols; the report fueled federal budget reductions and legislative initiatives to balance the federal budget. The 1993 National Performance Review and the reinvention movement promoted decentralization, flatter organizational hierarchies, and increased reliance on external service provision through contracting or privatization. The net result has been a growing preference within public administration for private sector models of management. Intergovernmental funding patterns also shifted in response to changing presidential agendas; common themes included the devolution of funding responsibility to the states and grant requirements for collaboration between public agencies and community service providers at the state and local level.^[3]

Combined pressures of devolution, reinvention and budget restrictions, states turned increasingly to the non-profit sector for direct delivery of services. Non-profit service providers are attractive to state governments for at least two reasons. First, non-profits can access private donations that could be used to leverage federal funds under the concept of matching grants. Second, non-profit organizations are also seen as trustworthy organizations and therefore may present less political or financial risk to state governments than for-profit service providers.^[4] Today, non-profit organizations are recognized as a vital element of policy relationships that touch state government.

Complex policy networks can be distinguished from other responses to devolution and the pressures of government reform. Networks move beyond the concept of privatization vehicles and outsourcing contracts through incorporation of greater numbers of actors and points of interaction between constituents. Networks incorporate actors across the intergovernmental spectrum but move beyond regional government arrangements by incorporating the dimension of public-private collaboration.^[5]

A final factor that contributed to the evolution of complex organizational arrangements in policy design and implementation has been the growing acknowledgment of certain public policy issues as essentially intractable or “wicked problems.”^[6] Policy solutions to “wicked problems” are formed through collaborative, often interdisciplinary, networks of stakeholders. As a response to these various pressures, new forms of organizational arrangements have developed in and around state government that depart from traditional, agency-based models of government service provision. State governments are now actively engaged in myriad networks of non-profit service providers, volunteers, advocates, and other units of government in order to design public policy and to accomplish policy objectives.

EXAMPLE IN THE FIELD OF EDUCATION POLICY

School-to-work programs illustrate the management challenges presented to state government by one type of complex policy network. School-to-work programs are established under the federal School to Work Opportunities Act of 1994 (STWOA). The goal of STWOA is the institutionalization of a new system to help students move from high school to productive careers. The Act (STWOA) is jointly funded and administered at the federal level by both the Department of Education and the Department of Labor, and federal grants are available to the states for design, implementation, and evaluation of school-to-work activities. Federal grant eligibility is predicated on construction

of state collaborative partnerships that represent the interests of a school-to-work system broadly defined. Specific constituencies within state government must be represented, including the governor, the state educational agency, and state officials responsible for economic development, job training, postsecondary education, vocational education, vocational rehabilitation, and the state human resource council. Collaborative partnerships also incorporate school administrators, parents, teachers, students, employers, business associations, organized labor, and community groups.

At the state level, a bureaucratic hierarchy is nominally imposed through the creation of a state school-to-work office. The state school-to-work office is embedded within the state department of labor or commerce, the governor’s office, or most typically, in the state department of education. The activities that must be coordinated for successful program implementation, however, involve diverse constituencies outside the jurisdiction of state government. Successful management in this context thus involves communication between representatives of formal and informal constituencies with distinct agendas. In some states, school-to-work collaborations emerged through the creation of new partnerships between educators and employers; in others, collaborations were created from existing bureaucratic arrangements such as employer councils formed under the Job Training Partnership Act, or state associations of regional groups of educators.

School-to-work policy also encourages local design and implementation to promote access as well as programming tailored to fit local needs. Federal policy does not mandate a specific institutional structure but broad accountability for program implementation and success rests with state government. Within this broad policy framework, state management efforts are diffused toward outside agencies and community groups. State government administrators invest considerable time in building and maintaining relationships and advancing policy objectives without hierarchical control or significant central management structure.

EXAMPLE IN THE FIELD OF CRIMINAL JUSTICE POLICY

Drug court programs present another dynamic example of a fluid arrangement of public and non-profit organizations that function in the absence of an established state hierarchy or centralized state management structure. Drug court programs or “drug courts” operate within the state court system across the states to provide early intervention and intensive substance abuse treatment for nonviolent drug offenders. Drug courts utilize intensive judicial intervention, early and

rigorous treatment, and in many cases, accelerated case processing within the state criminal justice system. As early as arraignment, defendants are screened and referred immediately to multiphase outpatient chemical dependency treatment programs, which include a strict regimen of contact with one or more treatment providers, frequent drug testing through urinalysis, frequent status hearings before a designated drug court judge, and participation in supportive services such as literacy and GED education, employment, and employability training. Criminal defendants are encouraged to participate in drug courts in exchange for expungement of the criminal record of the drug offense upon successful completion of the drug court program.

State drug court programs synthesize, manage, and monitor the efforts of law enforcement agencies and elected law enforcement officials, judges, elected executive and legislative offices, administrative agencies, and private non-profit service providers to accomplish specific policy objectives. Integrated and collaborative arrangements between public organizations from each of the three branches of government, administrative agencies, and service providers are required as a condition of federal grant funding under the Omnibus Crime Control and Safe Streets Act of 1994. Multiple public offices and agencies interact with multiple private service providers. Most service providers are non-profit or community-based organizations with distinct missions which may also include the advancement of religious tenets or faith-based philosophies.

Drug court models require extensive linkages, collaboration, and communication in order to operate. However, no formal hierarchical bureaucracy defines the complex policy network of the drug court. Local communities and the states are free to innovate in developing new organizational arrangements for governance and management of the drug court process.

COMPLEX POLICY NETWORKS AND MANAGEMENT CHALLENGES

As the examples in education and criminal justice policy illustrate, complex policy networks are not confined to a single state agency and are not fully subject to the governing authority or management of state government. Rather, complex policy networks exist in tension with the traditional hierarchical bureaucratic model of public administration. In contrast to the stable, long-term command-and-control relationships in the bureaucratic model, network relationships are far more spontaneous and are essentially transitory. In public management, networks overlap with bureaucratic hierarchies, thus management of complex policy networks is best considered in tandem with bureaucracy rather

than in opposition to it.^[7] This duality presents specific challenges for managers in state government in terms of governance, performance measurement, and the capacity of extended networks to deliver public services and public policy.

GOVERNANCE AND COMPLEX POLICY NETWORKS

Complex policy networks impact governance—the way in which government accomplishes its job. A significant body of policy implementation literature argues that the primary contribution of complex policy networks is to bring about policy failure through the pressures of various interest groups. A relatively recent line of research argues that complex policy networks can be studied specifically in terms of their ability to enhance policy success and may represent an alternative framework for analysis that is a more accurate representation of public policy implementation than top-down or bottom-up models currently in use.^[8] In extending the study of governance beyond the public agency context to the network, states will need to consider means of adapting the primarily vertical hierarchy of the public bureaucracy to organizational arrangements with considerably more extensive horizontal reach than that within the typical public agency. Such a task is made all the more challenging by the need for states to retain legitimacy as sovereign powers in organizational arrangements in which the distribution of power is highly diffuse.^[9]

ASSESSING CAPACITY AND THE ABILITY TO IMPLEMENT POLICY

Considering complex policy networks as a positive influence on policy implementation has extended the way in which state capacity is considered. Early assessments of state capacity for policy design and implementation focused on program management, policy management, and resource management as baseline elements necessary to accomplish effective public governance.^[10] Capability in program, policy, and resource management were considered in the context of traditional hierarchical bureaucratic arrangements; state agencies that possessed sufficient capacity were those that demonstrated successful levels of performance in the management of programs, policies, and resources. Successful bureaucracies were also dependent on the presence of specific functional capabilities within the ranks of public personnel.^[11]

Capacity also depends on the presence of organizational characteristics that enhance the likelihood of successful performance in policy implementation.

Intergovernmental management literature recognizes a process framework and skills that can be expected to activate and sustain intergovernmental arrangements, including authority bonds, exchange relationships, trust, and the effective use of information; in the increasingly networked environment, these skills have become critical aspects of the public management environment.^[12] Stakeholder support, mission valence, and leadership are now understood to be important characteristics of successful intergovernmental relationships.^[13] Factors that suggest success for complex policy networks include institutional arrangements built upon trust relationships between stakeholders, information exchange across constituencies, the effective use of information, and staff dedicated to those principles.

Despite the identification of personal and institutional characteristics that can be expected to enhance policy implementation and policy success, measuring the capacity or success of complex policy networks in implementing policy has proven to be elusive. Although the network itself is salient, systematic descriptions of the arrangements and roles of public and non-profit constituents vary widely, as do the descriptions of methods by which to assess success. One line of emerging research focuses on information exchanges between state policy administrators and non-profit organizations as a policy diffuses across the states. Research on the fifty-state implementation of school-to-work programs suggests that non-profit organizations may provide synthesized information about best practices and program evaluation that is particularly valuable to state administrators during the implementation process.^[14] Another emerging approach seeks to model the layers of activity within a network in order to assess the effects and interactions of various network components. A study of the implementation of the end of social promotion within the network that is the Chicago Public School system finds that school-level variations in implementation itself have an effect on the consequent changes in student performance.^[15] These examples of emerging research demonstrate potential avenues for further exploration of policy implementation in the context of complex policy networks and state government.

Building capacity for successful policy implementation is also predicated upon understanding how to define success. In the networked environment, state governments must also consider more specifically the goals they expect to accomplish, as states rely on entities outside the state itself for the design and delivery of public services and public policy. State governments will be challenged to move beyond a "one-size-fits-all" orientation. The complex policy network context argues in favor of multiple, flexible, and multimethod performance evaluation methods that capture the

diversity of actors and uniqueness of programs and missions.^[16]

CONCLUSION

The study of complex policy networks has advanced during the past two decades. At the same time, state government continues to face challenges in designing new governing structures for policy implementation that satisfy the demands of democratic accountability and the reality of complex networks in public administration. State government engages in complex policy networks on virtually every area of public policy. In managing policy implementation in these networks, states exercise sovereign authority by implementing the commands of the elected branches of government. In moving beyond traditional hierarchical models of implementation, states must now also seek to connect, promote, and evaluate the activity of multiple actors who are not public employees. Running through each of these challenges is the question of how to best equip public managers and the broader public workforce with the skills and knowledge necessary to perform in the complex policy environment. Future research in these areas holds much promise for state management efforts directed at policy design and implementation, which necessarily involve complex policy networks.

State Government: Promotion of Innovations

Keon S. Chi

*Center for State Governance Transformation, Council of State Governments,
Lexington, Kentucky, U.S.A.*

INTRODUCTION

There are compelling reasons for state officials to innovate with policies and programs. We need alternatives, new ways of managing government agencies and delivering public services, because many traditional and ongoing programs are not working as well as they should. Moreover, the public expect state policy makers and administrators to initiate creative policies and programs. The public also expect state officials to do more with less, especially during times of fiscal austerity and retrenchment.

Innovations are not easy to conceive or replicate, however, because new initiatives usually mean changes or disruptions in an organization. These barriers and obstacles to innovations stem from the nature of government and human resistance to change. Yet, there is hope for state policy makers who desire to overcome difficulties to innovate. Those who want to innovate should focus on problems that are widely recognized as urgent and need to convince others that the current system is not working. They might justify innovation on the basis of cost effectiveness or customer demand. Finally, although innovators may experience some setbacks along the way and go long periods without apparent progress, they should remain tenacious, patient, committed, and optimistic.

DEFINITIONS AND MODELS

As seen in the voluminous literature, research scholars tend to treat policy or program innovations somewhat differently than do practitioners. This is true particularly when defining an innovation in state government. Broadly stated, academic researchers tend to define an innovation as a discovery or the adoption of a policy or program that is new to an adopting agency or a state. In fact, nearly every political scientist and public management specialist who have done extensive research on state innovations have defined an innovation in very much the same way. They defined innovations from the adopter's perspective, not from the inventor's perspective.

For example, in his pioneering study on innovation diffusion in state government, Walker defined an

innovation as “a program or policy which is new to the states adopting it, no matter how old the program may be or how many other states may have adopted it.”^[1] According to him, innovation is not an invention or creation. For Savage, “an innovation is a policy adopted by a state for the first time.”^[2] Downs and Mohr defined innovations as “the earliness or extent of use by a given organization of a given new idea, where ‘new’ means only new to the adopting agent, and not necessarily to the world in general.”^[3,4] Similarly, Nice regarded innovations as policies or programs “new to the state adopting them, even if the policy was first adopted in other states years earlier.”^[5]

On the other hand, practitioners and others tend to define an innovation as an invention or a brand new policy or program that has not been adopted previously by other jurisdictions. They tend to define an innovation as a creation or a novelty, not a mere replication of a policy or program initiated by others. The Council of State Governments' (CSG) innovations awards program, for example, has used this definition since the program's inception in 1975. The national innovations awards program recognizes creative and novel initiatives in place that have proven to be effective in addressing significant policy, program, and management issues but have not been adopted by other states. According to this definition, therefore, replicating a program originated in other states would not be considered truly innovative.

Although innovations in state government take many forms, these forms may be grouped under the two broad types: political or policy innovations and program or management innovations. The first type includes large-scale or “macro” innovations, while the second type includes smaller-scale or “micro” innovations. In his study of innovations in the federal government, Polsby defined a political innovation as “a policy or a set of policies that seem to have altered (or promise to alter) the lives of persons affected by them in substantial and fairly permanent ways.”^[6] And Bingham, in his study of innovation in local government, defined a political innovation as a public policy.^[7] Thus, political or policy innovations in state government, as in the federal and local governments, may include those initiated often, but not exclusively, by enabling legislation. Policy innovations include

enacting statewide education reform laws, restructuring court systems, and providing ongoing welfare-to-work reforms.

On the other hand, program or management innovations are initiated as creative tools or means to implement political or policy goals more effectively and efficiently, with or without legislation measures. Examples of program and management innovations include productivity and management improvement measures as well as technology application. Experiences with the CSG and Ford Foundation–Harvard University innovations awards programs indicate that nearly 9 out of 10 innovations selected as semifinalists or finalists are program and management innovations, not policy innovations. Therefore, public administration and management specialists tend to regard innovations in terms of program and management innovations.

The process of originating innovations in state government has been analyzed in two models: policy planning and “groping along.” Under the policy-planning model, innovations are initiated, for example, with prior planning and well-designed, comprehensive implementation plans. This model is usually found in political or policy innovations. Under the groping-along model, innovations are taking place without much systematic planning. This model de-emphasizes the initial policy-planning idea or legislative requirements, in favor of discretionary or more flexible ways of accomplishing policy objectives through trial and error, often modified by experience. As one researcher observed, “policy-planning model encourages managers to pay careful attention to identifying the right innovative idea, drafting a statute or execute policy that fully reflects it, and planning in advance for problems that might arise in implementation. The groping-along model, by contrast, involves much less attention to the original idea or policy—quite a number of different policies might be effective at starting an organization down a useful path—and much more attention to the organization’s ability to gather and respond to operational experience along the way.”^[8] The policy-planning model may be more appropriate when explaining political-policy innovation processes, and the groping-along model can better explain program or management innovation processes.

A review of innovations in state government by the CSG innovations awards program suggests that most program and management innovations fall under the groping-along model. The same is true with the Ford Foundation and Harvard University innovations award program. According to researchers for the Ford–Harvard innovation award program, “Rather than emerging from systematic research projects or policy analysis, they (innovations) have involved one person or a small group drawing upon past experience and/or informal communications with colleagues in

other settings. Following initial conception the ideas have generally been quickly tried out in practice and have subsequently evolved via trial and error rather than formal experimentation or analysis. Given that the state and local governments almost never invest in research and development, this pattern was perhaps to be expected.”^[9,10]

REASONS FOR INNOVATIONS

The question, “why innovate,” has been discussed in terms of purposes, causes, and motivations of innovations. This question has also been answered by examining political culture, organizational environment, and personal qualities that attribute to initiating or adopting innovations by a state government. Direct and indirect reasons for policy and program innovations in state government include the following:

1. *Alternatives*: New ways of managing government agencies and delivering public services are needed, because many traditional and ongoing programs are not working as well as they should. State policy makers and agency managers need to come up with alternative policies and programs.
2. *Public confidence*: State policy makers and administrators innovate policies and programs, because they want to meet the public’s expectations and ultimately gain voter confidence.
3. *Doing more with less*: Increasingly, American taxpayers have tended to refuse to pay more taxes for government services. As a result, state policy makers and administrators are expected to “do more with less,” especially during periods of fiscal austerity and retrenchment.
4. *Managers*: Unlike in the past, state managers and workers today tend to regard innovations as part of their responsibilities. They also innovate, because they attempt to apply rational approaches to problem solving. State workers in many jurisdictions are also concerned about self-efficacy, self-esteem, and legacy.
5. *Businesses*: State officials innovate because private businesses do. The influence of the private sector in state policy making and administration has been tremendous, particularly when embarking on strategic planning and benchmarking, quality management and productivity improvement, and privatization activities.
6. *Competition*: The states are competing with each other in nearly every policy and program area, and the level of competition has been heightened in recent years. In order to compete with other states, they need to create new

programs or replicate policies and programs implemented by other states.

7. *Technology*: The availability of technology makes it possible to be innovative in old ways of conducting business in state government, especially in telecommunication and management information systems. In fact, many program and management innovations are linked to new technology application in state agencies.
8. *Funding*: For practical purposes, innovations are needed to obtain outside funding. State policy makers and administrators have to be more innovative to experiment with pilot projects or to acquire waivers from federal agencies, for example. They also need to develop new ideas for implementation to raise money from private sources.

INDIVIDUAL INNOVATORS

Individual initiators of new ideas in state government include elected officers, appointed managers, and ordinary workers. Innovators tend to possess certain qualities, however. Based on a review of background information on selected innovations and interview data on innovators, for example, a Ford Foundation innovations specialist characterized the distinguished qualities of state and local innovators as “product champions,” who can communicate their visions and mobilize support for new ideas. The major attributes of typical innovators include energy, persistence, knowledge of the problem, political astuteness, the ability to inspire people, and the capacity to work effectively with diverse groups.

One national survey of innovators in state government conducted by the CSG revealed that innovators are very well educated, with virtually one-half of the innovators possessing an advanced degree from a 4-yr institution.^[11,12] Innovators tend to have a diverse array of academic majors with concentrations in social sciences, business, education, and public administration as the dominant educational backgrounds. Many innovators appear to be mid-career employees who returned to school to advance to managerial opportunities and have prior experience in the private sector, mostly in nonprofit organizations or in private consulting firms dealing with government programs. The innovators in the survey sample were very active professionally. The majority belonged to at least one state and one national professional association. Close to a majority belong to two or more associations at some level. Interestingly, national associations appeared to be more important to innovators than regional associations.

The most common singular role pattern is for innovators to generate innovations as part of their

day-to-day professional responsibilities. The primary groups involved in helping the innovator develop the innovation are those individuals working with the innovator on a day-to-day basis, such as coworkers and supervisors. Innovators usually find their strongest support from those they worked with and from those groups most dependent upon their agencies' services. In more than 80% of the cases, according to the CSG survey, the innovation had a potential effect on the organization.

The individual innovators identified by CSG relied primarily on their immediate coworkers for professional information and secondarily on the professional associations to which they belonged. The innovators appeared to be aware of what other states were doing within their respective policy areas. One-half of the respondents said that they used innovations originated in other states as a source of information. More than 60% of the states mentioned as innovative were in regions other than the innovators. These results depart from the notion that innovators look primarily to regional neighbors when contemplating a new venture for their agencies.

INNOVATIVE STATES

Previous studies on state-level innovations have certain characteristics. First, the political scientists defined an innovation as a state law, not anything else. Second, they used laws in selected policy areas during certain periods to measure the innovativeness of states. And, third, researchers measured and ranked states according to the date or speed of adopting innovations. Thus, states that adopted laws earlier than others were deemed to be more innovative. For example, Walker ranked states according to composite scores of innovations, based on 88 state laws in 11 policy areas enacted by at least 20 states between 1870 and 1966. Gray's innovativeness rankings are based on only 12 laws in three areas: education; welfare; and civil rights.^[13] Savage used 181 laws from 15 policy areas to measure innovativeness of the states: 58 laws in the nineteenth century; 54 laws in the early twentieth century; and 69 laws in the late twentieth century.

As for future research, at least three points may be made regarding methodologies to measure the innovativeness of the states. First, as mentioned earlier, most scholars define innovations as adoptions of innovations implemented elsewhere. The point is that, if this definition is used, however, as a former NSF intergovernmental program coordinator once pointed out, “every state is an innovator,” because all states borrow ideas from each other.^[14] Some would argue that truly innovative states are “pioneering” or “bellwether” states. Therefore, not every state adopting

another state's program should be considered a pioneer or a bellwether state. The question is: Should we continue to define innovations from adopter's perspective?

A second point has to do with the use of state laws to determine the innovativeness of states. The question is, "Can we measure the innovativeness of the states based solely on their adoption of laws?" Laws are certainly a major source of information on how states are doing. Using laws might be a convenient but not necessarily the most comprehensive way of measuring a state's innovativeness. There appear to be several inherent problems, when relying solely on laws, in the study of innovation diffusion in state government, however.

First, the date of adoption of a law does not necessarily correspond with the timing of implementation of that policy. In many states, significant policy or program initiatives are implemented even before relevant laws are enacted. The delay in policy implementation may be attributable to several factors such as the state's budgetary constraints, administrative rules, and regulations. The issue is the elapsed time between the date of adoption of legislation and the time when the policy or program is actually implemented. The gap might prove to be significant in the study of innovation diffusion. In addition, some laws are subsequently changed or repealed. One might ask, therefore, "Can we consider a state innovative even if it failed to implement a new law adopted earlier?"

In addition, when measuring innovativeness based on laws, the content of the legislature measure might need careful examination. The early innovation studies virtually disregarded the nature and extent of an innovation. Perhaps, the researchers assumed that the same or similar types of titles of laws would contain the same or similar provisions. What they needed, it seems, was a list of laws with years of adoption by the states. Although states tend to replicate laws adopted by others, more often, they also tend to revise or sometimes improve such laws to fit their own situations. While the intent of laws might be the same, the implementation process can be substantially different. Should we pay attention only to the intent of laws and not to the methods of implementation? It is also possible to think about a situation where a laggard state can come up with more effective legislation that is more beneficial to the people.

Finally, perhaps more importantly, the previous studies on innovations virtually disregarded program and management innovations that account for most innovations occurring in state agencies. It should also be pointed out that most innovations fall under the groping-along model, not the policy-planning model.

INNOVATIVE ORGANIZATIONS

An innovative agency may be defined as "one in which everyone—from those on the leadership team, to middle managers, to front-line supervisors, to front-line workers—acts on a sense of responsibility for inventing, developing and implementing new ways of achieving the organization's mission."^{15]} In order to make a state agency innovative, leaders, managers, and front-line workers all must have clearly defined goals and proper roles to play.

First, goals are important when creating innovative organizations because goals can set directions organizations want to go, set specific targets to reach, and be measured by quality and quantity. Goals can help define outcomes in meeting the public's expectations and demands. Innovations may not occur without the appropriate organizational environment and opportunities created by leaders who can help articulate goals for managers and workers.

Second, leaders in innovative organizations must have personal qualities, including serious personal commitment and devotion; tolerance and openness to new initiatives, suggestions, and proposals; and a willingness to share power with others, including middle managers and front-line workers. Leaders in innovative organizations need to use realistic strategies developed jointly by managers, workers, union members, and others. Such strategies may be developed through total quality management or similar management tools.

Third, the role of middle managers should be clearly defined. Why are middle managers important in the innovation process? At least three reasons can be offered: Through "buying-in" activities, middle managers can have a sense of ownership of innovations; they can create an environment and allocate the resources necessary to implement innovations; and they can help continue and sustain innovations.

Fourth, to create an innovative agency, state policy makers and managers need to redefine roles of front-line workers. Behn has offered useful "hints" for involving front-line workers in the innovation process: 1) be immediately responsive to requests for improved working conditions (or when they ask for a new photocopier, produce it); 2) support mistakes (or sit next to the first honest innovator who is called before a legislative committee); 3) create an explicit mission and related performance measure (or give people a real reason to be innovative); 4) broaden job categories (or do not let each individual do only one narrow task); 5) move people around (or do not let workers think they need learn only one job for life); 6) reward teams, not individuals (or find ways to beat the formal performance-appraisal and promotion system); 7) make the hierarchy as unimportant

as possible (or at least walk around without an entourage); 8) break down functional units (or do not let the procurement guys tell everyone “no”); and 9) give everyone all the information they need to do the job (or do not let the overhead units hoard the critical data).^[15] Tell everyone what innovations are working (or have front-line workers report their successes to their colleagues).^[16]

DIFFUSION OF INNOVATIONS

Most studies on innovation diffusion have focused on horizontal diffusion among the states. Innovation researchers have attempted to explain why some states tend to be more innovative than others. One key question has been, “What causes a state government to adopt a new policy or program?” Despite many case studies on the question, findings of such studies may be classified into two models: “internal determinants” and “regional diffusion.”^[17]

The internal determinants model posits that causes of adopting innovations may be answered by examining internal characteristics—political, economic, and social—of a state. The classic answer to the question is that the larger, wealthier, more industrialized states adopt new programs somewhat more rapidly than their smaller, less well-developed neighbors. Other scholars found, however, that states that are innovators in one policy area are not necessarily innovators in other areas, and that “innovativeness is not a pervasive factor; rather, it is issue- and time-specific.” Still, some researchers discounted interaction effects in the innovation diffusion process and claimed that “only the policy itself can be assumed to be invariant over time.”

The regional diffusion model, to the contrary, focuses more on the influence of “geographically-proximate states” in the innovation adoption process. It has been widely thought that state policy makers and managers look primarily to regional neighbors when contemplating a new venture. There is no question that regionalism plays a major role in innovation diffusion. As mentioned in the previous section, however, innovators in state governments tend to replicate innovations from any states, not necessarily from neighboring states. Today, thanks to communications technology and other factors, state innovators can learn about creative and novel solutions to problems from any jurisdiction without regard to its location or characteristics.

How long did it take for all states to replicate an innovation in a given policy area? This question has been investigated by several political scientists. For example, based on 88 state laws enacted between 1870 and 1966, Walker found that the average elapsed

time of innovation diffusion decreased from 52.3 yr for all adoptions (or 22.9 yr for the first 20 states) in 1870–1899 to 25.6 yr for all adoptions (or 18.4 yr for the first 20 states) in 1930–1966. And, Welch and Thompson, based on 57 laws, including 52 from the Walker data, found the average diffusion time to be nearly 30 yr.^[18] It is interesting to see if the average diffusion time has further decreased in recent years. It can be assumed that the diffusion time may have drastically shortened in part because of the roles played by third parties, including federal agencies with a variety of financial incentives.

On the other hand, researchers on innovations in state government have paid little attention to vertical diffusion of state innovations, transferring innovations from states to the federal government. Vertical diffusion occurs because of “a search for ideas from within and pressures from below and outside to adopt policy innovations.”^[19] Vertical, as well as horizontal, innovations may be diffused through third parties—interest groups, profit and non-profit organizations, civic organizations, and national and regional organizations of state officials. Third parties can act as information brokers and catalysts by conducting various activities such as clearinghouses, publications, conferences and workshops; by offering policy options and recommendations; by providing technical assistance; by giving interstate consulting services; and with recognition and award programs to encourage continuous adoption of innovations.

The major national organizations representing state governments in vertical diffusion of innovations include the National Governors’ Association, the CSG, and the National Conference of State Legislatures. Other national organizations of elected state officials are the National Conference of Lieutenant Governors, National Association of State Treasurers, National Association of Attorneys General, and National Association of Secretaries of States. In addition, there exist a number of organizations of appointed state officials that can help states diffuse innovations from one state to another, and these include national associations of state budget officers, personnel executives, purchasing officials, state administration and general services, emergency management, parole and probation, and telecommunication and information resources.

CONCLUSION

Innovations are not easy to conceive or replicate, because new initiatives usually mean changes and disruptions in an organization. There are institutional barriers as well as employee resistance to innovations,

especially from those affected by implementation new policies or programs. The absence of pressure or incentives is another obstacle in adopting innovations.

State Legislative Fiscal Offices and State Government Administration

Anita Chadha

Department of Social Sciences, University of Houston - Downtown, Houston, Texas, U.S.A.

INTRODUCTION

The Legislative Fiscal Office (LFO) serves as an important support agency for legislatures in all 50 states. Nonetheless, relatively little research has been done on their operations, authority base, or duties and functions. It is generally recognized that LFOs provide financial data to legislators enabling them to make more informed decisions. The responsibilities of LFO may include development of legislative fiscal notes (LFNs), short assessments of revenue and expenditure implications of proposed legislation or analysis of executive agency estimates of such implications. Some LFOs assist legislators in developing alternatives to the executive budget; others have responsibility for research reports, and program and management evaluations.

There is interstate variation in the structural arrangements of LFOs. Some states have two separate offices (dual LFOs)^a serving the upper and lower legislative chambers, respectively. Other states have a single office (joint LFOs) which serves both chambers. Dual LFOs tend to perform more functions and utilize more resources than joint LFOs,^[1] suggesting that competition between chambers and their fiscal agencies leads states with dual offices to expand their scope and to increase their support. Regardless of form, the principal goal of the Legislative Fiscal Office is to provide factual, objective information to legislators in a timely fashion.

BACKGROUND

Research on the LFO specifically and legislative staffing generally has been limited,^[2,3] dated, and primarily focused on single-state case studies done in the 1970s. There have been few comparative studies of legislative staff,^[4,5] which is unfortunate. In recent decades, legislative staffs have grown rapidly in size and functions, making them important forces in the development of state policy.

To provide comparative data on legislative fiscal offices, several questions regarding their performance are addressed in this article: What are the duties assigned to the LFO by state law or legislative rules? Which duties receive priority? What is the LFO workload? What are their staffing levels? Are there functions that LFOs have assumed on their own?

Data on duties, functions, and workloads of LFOs were collected in a two-phase survey conducted in 1997 and 2000.^[1,6] The surveys included questions on the amount of time spent on functions, numbers of support staff employed, estimates of the numbers of fiscal notes, research reports, program evaluations, and other analyses performed. Additional questions focused on those duties and functions dealt with in the past years.

DUTIES PERFORMED

Survey results indicate that state law and/or legislative rules can assign LFOs authority to perform a variety of budget-related tasks, including writing fiscal notes for bills, forecasting revenues, evaluating the executive budget(s), developing alternative budgets, and assisting in the development of legislative budgets. While state law or legislative rules may assign LFOs authority to undertake these varied tasks, not all states perform all authorized tasks. Conversely, in a few states where no legal authority or legislative rule exists, the right to perform a task has developed over time. To assess the relative importance of each duty or task, an estimate was made on the amount of time the LFO spent on budget development, fiscal notes, research reports, program and management evaluations, and staff support.

Budget Development

Not surprisingly, budget development received the most attention among the duties performed during regular sessions. Three-quarters of the responding LFOs reported that one-third or more of their time is devoted to this task. However, the number and type of budgets developed vary greatly. In some states one unified budget is developed; in others, two or more separate

^aThese states are Florida, Massachusetts, Michigan, Minnesota, New York, Oklahoma, Pennsylvania, and Rhode Island.

budgets deal with specific aspects of state operations. Over 91% of LFOs performed some budgetary function. There are differences in time spent on budget development, when budgets were framed (whether during regular, special, or between sessions), and when the different kinds of budgets were considered.

There are many reasons for this variation. For instance, differing constitutional, statutory, and judicial constraints govern the number of budgets passed for each state. Also, state legislatures differ in the number of budget bills that are introduced and considered. States may have separate committees in each chamber with some exercising the responsibility for both revenue and spending matters and others having the sole responsibility for one or the other.

While 20 state legislatures entertained only a single budget bill, legislatures in the other 30 states considered from 2 to 350 separate budget bills. By way of illustration, the Oregon LFO assisted in developing 126 different versions of unified budgets, while the Oklahoma upper house LFO assisted in developing 156 general fund budgets. The LFO in Alabama (one of six states that do separate education budgets) assisted in 10 versions of that budget. The Alabama LFO is also one of eight that assist in add-on or special budget development. On the other hand, several LFOs, such as those in Colorado, Georgia, Maine, and Virginia, are not required to assist in developing unified, general, special, or add-on budgets.

Fiscal Notes

Legislative fiscal note drafting is an aspect of budgetary activity historically identified with LFOs. It is second in importance only to budget development as a duty performed during regular sessions. The fiscal office generally prepares a written fiscal note for each general bill that will have an impact on state or local government finances. The fiscal note is designed to provide information as to the fund or agency budget that will be affected, in what manner, and by how much. The aim of the fiscal note is to give the best estimate of a bill's fiscal impact to legislative committees and the full legislature prior to consideration of that bill.

Legislative Fiscal Offices vary in the number of fiscal notes written (ranging from 0 to 7361) depending on formal requirements. Some LFOs, such as those in Alaska, Arkansas, Georgia, Kansas, Minnesota, Virginia, Washington, and West Virginia do not write fiscal notes at all. The number of fiscal notes is affected by the number of bills introduced in a session and the specific details on how fiscal notes are treated and counted. For example, a bill can have more than one fiscal note depending upon the number of times the bill is amended. In some states, as a bill moves from

chamber to chamber, new fiscal notes are written. But, in other states, no fiscal notes are required of a House bill that does not affect state revenues or expenditures, though Senate bills are required to have fiscal notes.

The number of notes reported varies for several reasons: states allow or require fiscal notes on all bills, others require them for all bills reported from committee, and still others require them when requested from a named official. In some states without statutory or rule authority fiscal notes may be produced according to the logic that, if law or rule neither authorizes nor denies such authority, its use is discretionary.

Duties are assigned to LFOs by state laws and legislative rules. The fact that 52% of LFOs responded to the 1997 survey and 62% responded to the 2000 survey indicated that state law and/or legislative rules authorized legislative fiscal notes. Overall, fiscal notes are produced by more fiscal offices than reported here, as some LFOs write fiscal notes only for bills reported out of committee, or when requested.

Research Reports

Another general responsibility of legislative fiscal offices is the writing of research reports. The relative importance of reports varies; some LFOs do considerable research (the Oklahoma lower house LFO produced more research reports than any other office in all categories), while others do none at all. Reports are done in response to requests from several sources. Survey responses in 1997 and 2000 show that 82–88% of the reports were for individual legislators and committee chairs. In 1997, 79% of the LFOs, and, in 2000, 84% of the LFOs state that they have authority to initiate their own research reports. Offices in two states, Georgia and West Virginia, can produce reports for the governor. In both 1997 and 2000 committee chairs were the group most likely to have the authority to ask for LFO research reports.

Evaluations

Monitoring programs to ascertain their compliance with legislative intent and statutory authority may be another function of legislative fiscal offices. The monitoring frequently involves efficiency and effectiveness measurements to determine if programs are accomplishing specified goals and objectives. Evaluations can be program or management based. In 1997, the Nevada LFO did the most program evaluations reaching 450.

In some 10 states, LFOs have done program evaluations that were requested by legislators, legislative officers, committee chairs, or the self-initiated. According to survey results, authority to do program evaluations for individual legislators was done by 54% of LFOs in

1997 and 51% in 2000. Authority for evaluations for legislative officers was available to 49% of LFOs in 1997 and 58% in 2000; for committee chairs, 44% in 1997 and 66% in 2000. None of the legislative fiscal offices did program evaluations that were requested by the governor.

Staff

Adequate professional and support staff is an important determinant of workload and performance by legislative fiscal offices. With 113 personnel, Texas had the largest full-time staff, followed by the New York Assembly with 40, Colorado with 39, and Virginia with 35. The smallest staffs were in Vermont and West Virginia (four members). The Texas LFO also had the largest full-time secretarial staff with eight; LFOs in Alaska, Vermont, Washington, West Virginia, and Wisconsin had none. As for clerical staff, the Texas LFO again led with eight and again several LFOs had none.

CONCLUSIONS

Assessments of the work of Legislative Fiscal Offices is important for advancing basic knowledge of state legislative performance and interstate variations in institutional capacity. In this article, the workloads

and functions performed by LFOs have been examined. Explanations have been offered for differences in workload and functions over time structure of LFOs (joint vs. dual), difference in responsibilities during and between legislative sessions, and legal authority to perform specific tasks. It is now possible to study systematically the implications of differences between and among LFOs in support to state legislatures.

INTRODUCTION

Strategic management is the effort to capitalize on the strengths of an organization by taking advantage of favorable conditions inside or outside the organization. It involves minimization of cost by making operations consistent and predictable, and by avoiding challenges to structure and the organizational culture. Thus, it is the process for implementing a strategic plan that integrates the organization's goals, policies, and action sequences into a cohesive whole. That plan, as an expression of strategic choices, is the product of a carefully elaborated and orchestrated decision-making process. According to Quinn,^[1] strategic decisions:

- Intimately shape the true goals of the enterprise
- Help to delineate broad limits of operations
- Dictate both the resources of the enterprise that will be accessible for its tasks and the principal pattern in which these resources will be allocated
- Determine the effectiveness of the enterprise—whether its major thrusts are in the right directions given its resource potential—rather than whether individual tasks are performed efficiently

Strategic management has the potential to affect organizational performance, but it is not a guarantee of success or productivity. It can easily go wrong, leading organizations astray. Regardless of its results, strategic planning always involves the consumption of a lot of precious organizational resources that could have been used to underwrite other important organizational activities. For example, the time, creativity, and budgets used for developing strategic plans could have been used to provide employees with cross-training or to build team spirit. Such activities have the potential for improving organizational performance just as strategic planning does. Yet, when strategic planning is done right and the organization is capable of taking advantage of it, it has much to offer. The complexity and the rapidly changing circumstances under which public administrators must operate make strategic management a necessity. Recent advances in information technology make the development and use of strategic plans easier than it used to

be. Further, legislation resulting from efforts to increase accountability and performance, such as the Government Performance and Results Act of 1993 in the United States^[2] or Best Value in the United Kingdom,^[3,4] made the development of strategic plans, as well as annual reporting on the effort to implement them, a mandate.

The conceptual framework for strategic planning and management can be a potent tool for administrators because it facilitates systematic thinking. The strategic planning phase helps managers to relate assumptions (about the environment, desired results, availability of resources, and capacity) to a blueprint for action. The enhanced capacity to manage the organization strategically results from several things.

First, the strategic plan provides all members of the organization with a common frame of reference for taking care of their daily choices among competing options for action. As such, a good strategic plan can serve as a great coordinating mechanism for all management levels. Asking all employees to rank-order such options according to how they can contribute to the ultimate organizational objective is important it helps to reduce the odds that the wrong action will occur because on its face it seemed to serve best the interests of a subunit or a short-time need. In other words, the availability of a strategic plan can reduce the odds that the organization will miss its target due to suboptimization.

Second, the strategic plan defines necessary feedback and feedback loops as a function of programmatic (i.e., the need to know) rather than ceremonial (i.e., the right to know) considerations. The strategic planning establishes precontrols over the discretion of lower-level managers by defining important values, desired results, and relevant considerations. This, in turn, contributes to consistency in the handling of similar decisions by different individuals and the various organizational units, and it increases the predictability of operations.

This article describes the main characteristics of strategic planning and management, and points out how they can influence and contribute to productivity. The article starts with a discussion of two basic ways of approaching strategic planning. It goes on to describe

the various steps of a simple model of strategic planning and some of the necessary conditions for getting the most out of it.

MISSION STATEMENTS: TWO APPROACHES TO STRATEGIC PLANNING

A mission is the ultimate goal, philosophy, or purpose of an organization. In the case of a private organization, the mission provides the answer to such questions as what is our business? or what beliefs or values should guide us? A company's mission is defined as the fundamental, unique purpose that sets a business apart from other firms of its type, and identifies the scope of its operations in product and market terms.^[5] The missions of public agencies, however, justify their right to exist and use public resources. Sometimes the mission of a public agency is written into the enabling legislation that created the agency, but often legislation such as GPRA at the federal level or an executive order by a governor at the state level can mandate the development of a mission statement or articulate it in connection with an effort to review performance. Governor George H. Ryan Executive Order no. 7 (March 1999) "Creating the Office of Statewide Performance Review" for the state of Illinois is one possible example that illustrates this point.^[6]

According to Byars, without a concrete statement of purpose, it is virtually impossible for any organization to develop clear objectives.^[7] If this assertion of Byars is true, one must wonder whether a public manager can be successful in an effort to develop a strategic plan and to implement it. After all, in the public sector, developing a mission statement and deriving clear objectives from it are much more difficult and complicated than they are in the private sector.

The missions of agencies are sometimes set by various pieces of laws and court decisions, or within a specific law or a court decision. In such cases, managers have little discretion and agency employees may have little, if any, input, even though they may be the experts whose advice the agency should seek. In theory, when a mission is not articulated for an agency by outsiders (i.e., the legislature or the courts), managers will have more of a say about how to develop it. In the absence of a mission statement created by legislation or court decision, newly elected officials and appointed administrators have some flexibility to chart their preferred courses of action and to break away from the priorities and practices of those who used to be in office. In practice, however, this discretion may be taxing. When public managers need to derive a mission statement from multiple sources, they are likely to find the cards are stacked against them. The guidelines they may be able to derive from various

sources may be either too broad, too vague, or inconsistent with other regulations that govern operations (e.g., the directives of central staff agencies such as the Office of Management and Budget or the Government Accounting Office). Under these circumstances, they do not have the convenience of saying "this mission was written into the law (or court order)" while having to come up with excuses for all the things they wanted to include in the mission statement but could not.

The purpose of the mission statement in public agencies is to allow the formation of a winning coalition to support acceptance of the strategic plan by stakeholders both within and outside the agency. The general language, which allows members of the coalition to give it different interpretations, is often the only way of making the mission acceptable to various stakeholders. A mission that is too concrete may deprive the coalition from the support of some important stakeholders. Thus, one reason for the difficulty public agencies have in enunciating clear objectives is that they need to be derived from a mission statement that was articulated to serve a political function—to mobilize support for the strategic plan—rather than to facilitate the actual planning process. Thus, the mission statement that can bring unity and conformity in the case of a private organization may bring diversity and create ambiguity in the case of government agencies.

In the public sector, participation in the process of developing a strategic plan and the document that results from it can reduce the haze and cultivate a common understanding of the mission across the board. Although private sector organizations can secretly assign the development of strategic plans to ad hoc teams or specialized units, strategic planning in the public sector must be open and involve broad-base participation. Such a planning process is needed in the public sector for two reasons. First, it may accord the strategic plan its legitimacy. Second, such an open process is needed for fostering a sense of ownership of the resulting plan by those whose support and cooperation are critical for its implementation.

It is possible to identify two major schools of thinking about strategic planning and the mission of the organization.^[8] One school views the strategic planning process as an analytical exercise that results in the definition of a mission for the organization. Byars, for example, claimed that an organization's purpose must be defined at its inception, and then be redefined regularly during both difficult and successful times.^[7]

The second school of thought assumes the pre-existence of a mission. According to this second approach, the purpose of strategic planning is to identify the preferred way of carrying out a given mission, optimizing the use of resources by adopting an outward perspective.

Subscribers to the first approach assume that those involved in the strategic exercise are empowered to define and redefine important parameters of the system. The analysis results from concerns about past, present, or future performances of the organization. The only guideline for developing the plan is that it should lead to a better future. In 1787, the Founding Fathers in Philadelphia approached their task in this manner. They redefined the mission of the central government and articulated some important values for the purpose of forming a better union. The values and the definition of the mission were then used as parameters for devising a mechanism for carrying out the mission and for preserving the union as they envisioned it.

A SIMPLE MODEL OF STRATEGIC PLANNING

Developing the Metaplan

The first step in the planning process calls for a general investigation of the internal and external environments of the agency. The purpose of the investigation is to establish the boundaries of the relevant environments. What issues, considerations, organizations, constraints, groups, or individuals should be included in the analysis, and what should be left out? What is an adequate timeframe for making and using projections in the plan? What is within the domain of the agency, and what should be considered outside it? What forces exist in the agency's immediate (i.e., operating) environment, and what forces shape this environment by influencing the general environment?

Dror stressed the need to establish a clear framework for action that is commensurate with the authority and resources of the agency. He used the term cutoff points, or horizon, to delineate time, territory, and spheres of social activity beyond which the effect of a policy can be ignored.^[9]

One way of arriving at the cutoff horizon is by "stakeholder analysis."^[10] A preliminary stakeholder analysis means the identification of coalitions of groups and individuals within and outside the organization who have a stake in the status quo. The analysis next requires the identification of issues that are important in the present and those that will become important within 5 to 10 years. Then the potential influence and interest of each stakeholder in issues of importance, in the present or in the future, can be estimated. Those coalitions, groups, or individuals who do not seem to have a direct or long-term stake in what the agency is doing, or in issues that are important to the agency, may be excluded from the analysis. The same is true for issues that are not salient on the agenda of any important group.

A cutoff horizon can reduce the strategic planning effort to a manageable task, but this benefit is not without risk of ignoring some important issues, groups, or individuals. Some of the risk results from the fact that groups and individuals may relate to a given issue in more than one capacity.^[10] It is not easy to estimate whether a group or an individual is consistent in reactions to a given issue as the capacity of involvement changes. For example, employees of the state department of education may have different reactions to a new tax to finance education in their capacities as taxpayers, parents of school-age children, or department employees.

To reduce the possible consequences of such an oversight, the organization should reexamine the assumptions and considerations that were used to frame the boundary of the analysis. Such examinations should be woven into the planning effort itself as part of the planned iterations. The strategic plan should include set intervals for reevaluation of said assumptions during the implementation of the strategic plan. Such examinations may coincide with the development or review of proposed budgets.

The purpose of the investigation is to establish the backdrop and the framework for the strategic planning process. Even though it is usually limited in scope, it should give the individuals in charge of designing the planning process some insight into the issues that should be dealt with during the planning effort. In other words, the metapanning phase is the time when the organization sorts the wheat from the chaff by determining what constitutes a strategic issue and what does not. The importance of the investigation for strategic issue diagnosis is that it delimits and constrains subsequent information collection, evaluation, and choice.^[11]

Bryson suggested that "identifying strategic issues is the heart of the strategic planning process." He pointed out that the purpose of this step is to identify the fundamental policy choices facing the organization.^[12] The model presented in this article uses a different approach to avoid some of the difficulties that were identified by Bryson. The effort to identify strategic issues is an attempt to define the forces that will shape an agency's environment and influence its freedom of action. The model assumes that it is only after a force field analysis has been completed that the agency may be in a position to identify "fundamental policy choices." Using this approach, which allows for redefinition of the force field or any of its elements, the model creates an environment that is conducive to an orderly development of the strategic planning process. The model makes two important assumptions. First, it assumes that any disagreement about the forces that is going to affect the agency is going to be less trying for the participants if it is divorced from

the effort to select a course of action for dealing with them. Second, the model assumes that participants in the planning process are more likely to cooperate if the initial working paper, which contains a tentative, preliminary inventory of critical issues, is produced by the coordinator of the planning process rather than by one of them. Knowing that the inventory can and is likely to be revised as the planning process progresses, and not having to defend a position that was taken before the beginning of the process, can induce cooperation. In other words, by developing a working paper before the beginning of the planning process, the coordinator of the process allows the participants to question and research the issues without attacking or putting each other on the defensive.

The investigation is usually part of the metaplaning phase because its results should influence the scope, timetable, and organization of the planning process. To use an analogy, the investigation during the metaphase of the planning process corresponds to the work of a Grand Jury. In each case, the products establish the case for subsequent action, providing the justification and the framework for a more comprehensive effort of data collection and analysis.

The metaplaning effort serves two purposes. First, it develops a model of the proposed planning process. The model is a logical presentation to help participants to understand and anticipate the various stages of the process, and to see how each step of the process will lead to the other, and how and why each step forward requires a review of implications for earlier work. The second purpose of the metaphase is to estimate the necessary time and resources for completion of each step, control, and coordination mechanism for facilitating the process (e.g., PERT (Project Evaluation and Review Technique) diagram), and the apparatus for evaluating the quality of the strategic plan and the process for its development. In essence, the purpose of the metaphase is to provide the individual in charge of strategic planning the necessary information to carry out the planning process and to evaluate it.

Taking Stock

The second step of the strategic planning process is a comprehensive, indepth collection of data. With advances in information technology, most of the effort may involve retrieval of information from sources inside and outside the organization. The convenience and efficiency of this option should always be evaluated against the possible error, noise, or built-in bias that are likely to result from the use of data that were initially collected for other uses.

The purpose of this second step is to take a snapshot of the relevant “reality”—the proper context for

assessing the existing situation and alternative courses of action. To facilitate this step, the leader of the planning effort should consult with prospective users and participants to define the set of questions that should guide the collection of data. The questions may be grouped into distinct categories such as:

- What are the legal requirements, mandates, or constraints that must be observed by the agency? What authority does it have? What is the scope of its discretion in exercising this authority? What other bureaus can influence or be influenced by what the agency is doing? What is the relationship between all of these and the evolving economic, political, and social trends?
- What is the relationship between past and present performance, and the interest of various stakeholders? What is the common interest of coalitions, groups, or individual stakeholders in each policy arena? How strong is the interest of each member of such a coalition in what the agency is doing (or, in how it does it)? What is the likelihood that any of them may change their stated position and join another coalition? What may cause such a change?
- What are the indicators of a popular desire to see a change in the formal definition of the agency’s mission? What indicates a desire for a change in the agency’s formal structure or administrative practices as established by the enabling legislation? What forces are seeking to affect interpretation of the law, informal practices, and the use of discretion?
- Using professional standards, what can be said about subcomponents of the agency or elements of the program(s) under its jurisdiction? What are the horizontal and vertical interdependencies among subunits? What is the functional nature of these interdependencies,^[13] and which ones are critical? Do top administrators, rank-and-file employees, preliminary service recipients, and other stakeholders recognize and agree on the existence of interdependencies?
- What is the reputation of the agency among legislators? the media? central staff units that regulate and determine allocation of resources like budgets or personnel? groups other than the primary stakeholders?
- What are the expectations and preferences of top agency officials about issues such as substantive results, use of resources, organizational structure, administrative practices, relationships with various stakeholders, and new initiatives?
- What are the possible implications of changes in office and information technology given current political, social, and economic trends?

- When it comes to the services the agency provides different publics, what are (and what should be) the relationships among variables such as capacity, quality, queuing, equality (equity), automation, staffing levels, client group awareness, multisite operation, use of vendors, and user fees?

Strategic Analysis

The third step of the analysis involves a critical review of the answers to all the questions about the agency, its operations, structure, the way it relates to the external environment in the present, and the way it should relate in the future. The product of the third step of the strategic planning process is a list of alleged strengths and weaknesses. A strength is a virtue (e.g., well-trained personnel or relevant past experience). A strength indicates a capacity to operate without the presence or the prospect of interference. A weakness is a deficiency. It indicates a threat to organizational capacity or the value of the goods or services it provides, unless there is a change inside or outside the agency. Low morale, burnout, poor image, inadequate facilities, lack of experience, or insufficient resources are common reasons for weakness in public agencies.

The disclosed strengths of the agency establish the desired direction for developing alternatives for action. The weaknesses reveal the constraints on action and areas where change is necessary. The exact definitions of what constitutes a strength or a weakness must be developed during this stage and requires direct input from top administrators. The reason is that what may constitute a weakness for one may be a source of strength for another. For example, one chief of police may consider a public image of a trigger-happy police force as a helping factor due to its contribution to deterrence. Another chief may consider such an image as an obstacle to effective action because it reduces trust and communication with minority groups.

Alternative Generation

The fourth step of the strategic planning process is identification (or generation) and comparative analysis of alternative courses of action. Using the strengths and weaknesses that were identified in the previous phase of the planning process as guidelines, the organization seeks ideas about what can be done and what should not be done, and why. To identify as many ideas and alternatives as possible, the metaplan for the strategic planning process may call for the simultaneous use of several independent efforts. Some of the techniques for generating ideas through mobilization of insights and different kinds of knowledge include the use of expert systems,^[14] small (focus)

groups,^[15,16] brainstorming sessions,^[17] use of Delphi or simulations, consultants, advisory groups, and electronic bulletin boards.

There are four reasons for the simultaneous use of several of these techniques. The first reason is to assure that no viable option is ignored. Different techniques may be more suitable for helping various individuals and groups articulate insights and desires about the agency and its management or programs. Second, the effort to establish an inventory of options should facilitate the collection of information and opinions so that the virtues and implications of each option are not over- or underestimated. Use of different techniques reduces the odds that an important consideration will be overlooked. The third reason is that simultaneous use of different techniques can speed up the process and prevent a stalemate. The fourth reason is that by use of alternative techniques and by involving different groups, the organization increases the odds for overcoming cognitive deficiencies, which can mar the initial identification of strategy and the development of the metaplan.^[18,19]

The various alternatives for interpreting the enabling legislation (the mission), the options for organizing the agency (the grand strategy), and possible administrative practices (functional strategies) should then be ranked on the basis of two considerations: 1) the extent to which they take advantage of agency strengths and avoid its weakness; and 2) the extent that they are in line with the preferences of important stakeholders. Ignoring either consideration may defeat the whole purpose of developing a strategic plan.

Strategic Choices

In the fifth step of the planning process, the organization chooses the options for implementation. This includes commitments to achieve specific annual objectives and to follow particular functional strategies and policies, institutionalizing the strategy and establishing of control.^[5] In selecting an option for implementation, the organization determines the following:

- What is the agency out to achieve?
- What will be done to achieve it?
- Who is responsible for each element of the program?
- What is the timetable for carrying out the plan?

Organizational Leadership and Support

The implementation of any plan requires preparation. The purpose of this sixth step of the strategic planning process is to tie the necessary preparation to the planning process itself. Lack of resources or any other

constraints on making the necessary preparations should be taken into consideration and influence the development of the plan.

Sometimes the preparation for implementing a strategic plan may call for special training,^[20] purchasing of new services or equipment, modification of facilities, or rewriting of manuals. Some of the preparations may require a lead time. The gap between selection of a strategic plan and the beginning of the implementation process provides a fertile ground for rumors and other activities that may jeopardize the success of the plan.

Therefore, even before preparing to implement the plan, the organization must embark on a campaign to educate all employees and other stakeholders about the plan and how the organization is going to prepare for it. Managers should treat the implementation as an introduction of a planned change. They must be ready to provide leadership and willing to get involved in mobilizing support. According to Holden, if strategic planning is to be a productive management function, support for it must exceed the resistance against it.^[21] It follows that in the absence of strategic leadership, the creation of an overall sense of purpose and direction that guide integrated strategy formulation and implementation,^[22,23] sufficient level of support within the organization is unlikely and the wisdom of engaging in strategic plan should be questioned.

Review and Evaluation

During the seventh step, the organization establishes milestones, and a framework for monitoring and evaluating the implementation process. Establishing this framework in advance of implementation prevents the temptation to rationalize (or excuse) deviations from the plan. It helps the manager to identify such deviations and scrutinize assumptions that were used for developing the plan.

The evaluation framework defines the quantitative and qualitative measures of input, process, and output of each subsystem of the agency. Classifying an administrative subunit as a revenue, cost, or responsibility center^[24] allows the manager to compare expected and actual performance. It also allows the organization to trace the relative contribution of each subunit to the use or generation of resources.

RESPONSIBILITIES AND ROLES IN STRATEGIC PLANNING AND STRATEGIC MANAGEMENT

The strategic planning process can be a bottom-up or top-down planning process. As a bottom-up process, the effort begins with investigation of the

environment by each subunit. The data from all the units reaches a central location that uses it to develop a tentative design for the planning process. This design—the metapanning phase of the strategic planning effort—is then circulated for comments and suggestions before it is finalized. The final design provides each unit of the organization with a timetable, the division of labor, and the various stages of the process to develop the strategic plan.

When the process originates at the top, the initial study is carried out by a central unit that also develops the first draft of the design for the planning process. The draft is circulated for comments before it is finalized.

Selection of a top-down or a bottom-up approach depends on the distribution of strategic planning experience throughout the organization and the availability of resources. Organizations that have gone through the process of strategic planning once may benefit from an action research approach where the planner and those who will be asked to implement it collaborate.^[25] Action research assumes participation by all employees and thus is less biased by the perspective from the top. Such an approach can lead to better definitions of issues and considerations than an approach that limits participation. However, when prior experience of strategic planning is missing or when the organization cannot spare the resources to train employees before the beginning of the strategic planning effort, subunits may spend too much time pondering and wondering what is expected of them or how to do it. The organization may save time and unnecessary aggravation by using professionals to conduct the initial survey that establishes the parameters or boundaries of the planning process.

The person in charge of the strategic planning process is a broker of knowledge. This person needs to know something about the agency and its special circumstances. However, the person's primary expertise should be in strategic planning—the how and why of going through the various steps of the process.

The person in charge of the strategic planning effort is also a change agent. As such, the person needs to bring to the organization extraordinary leadership and interpersonal skills. The strategic planning process involves scrutiny of past achievements, reordering of priorities, possible shifts and changes of structure, and personnel and administrative practices. All these may threaten employees' careers, job security, seniority, authority, or power, and they can generate tension, particularly in labor relations. As a change agent, the coordinator of the strategic planning effort should be able to smooth ruffled feathers and reduce the uncertainty.

To be successful as a change agent, as a broker of knowledge, and as coordinator of the planning process,

that individual must have the support of top officials and easy access to the ranking administrator. All agency employees should know that the individual's authority to request cooperation or data is derived from the authority of the chief administrator. The administrator should spare no effort to communicate to the rank and file the importance of the strategic planning effort and the commitment of the organization to see it through. Without clear and strong commitment from the top, employees may not take the strategic planning effort seriously. This, in turn, may lead to delays or may compromise the quality of the data being collected by employees for the planning effort.

The importance of organizational commitment cannot be emphasized enough: without it, the whole effort does not stand much of a chance. After all, for most agency employees, participating in and contributing to the planning process is a duty that is added to their regular responsibilities. Most employees like to be involved, but resent the extra work they need to do just for the planning effort. Thus, special attention should be given during the design of the strategic planning effort to building good will.

In a similar way, the organization should spare no effort when familiarizing employees and stakeholders with the strategic plan, the rationale behind it, and how its various parts are related. Such efforts should reduce ambiguity, and counteract the influence of rumors and allegations that may interfere with the implementation of the plan. The symbolic value of educating employees and the public about the plan will help the organization to legitimize and secure cooperation for implementing the plan.

CONCLUSION

Halachmi^[8] questioned whether strategic planning and management are likely to be as useful or feasible in the case of all public agencies. In one publication,^[26] he asserted that well-performing organizations are likely to be able to take advantage of strategic planning and management, whereas weaker agencies may not. In the early 1990s, Mintzberg, who wrote extensively on the subject of strategic planning and management, suggested^[27] that the inherent characteristics of planning and strategic management may undermine one at the expense of the other. According to Mintzberg, planning involves analytical and systematic analysis and thinking, whereas strategic management involves a synthesis, learning and thinking outside the envelope. In his words: "Strategic planning is not strategic thinking. Strategic planning often spoils strategic thinking... this confusion lies at the heart of the issue: the most successful strategies are visions, not plans."^[27]

The implications of the observations offered by Halachmi and Mintzberg are clear: strategic planning and management may be a useful tool for all managers, but they may not be suitable for all organizations.

Subnational Counter-Cyclical Fiscal Policy in the United States

Yilin Hou

*Department of Public Administration and Policy, University of Georgia,
Athens, Georgia, U.S.A.*

INTRODUCTION

This article is a review of the counter-cyclical fiscal policy (CCFP) at the subnational level in the United States. The term “subnational” is used in contrast to “national,” referring exclusively to the 50 states. Although the literature and data used are restricted to the United States, the academic and practical implications go beyond this country because budgetary stabilization at the subnational level has been a universal topic, bearing significance in many other countries as well.

This article is organized as follows: “Evolution of Theory” examines the origin and development of CCFP in the United States, which, in a period of about 70 years, presents many lessons. “The Practice of CCFP by State Governments” looks into the practice of CCFP by state governments, covering the choice and shift of policy instruments and responses to states’ use of CCFP from the capital market, professional organizations, and the United States Congress. “The Future of CCFP” shifts focus onto the future of CCFP. It will consider the ongoing argument about the economic stabilization function of CCFP as well as the fundamental public good of reducing revenue shocks from economic fluctuations. It ends with the proposition that CCFP is not a panacea; politics and basic budgetary discipline are the ultimate baseline.

EVOLUTION OF THEORY

The study of business cycles has a history almost as long as the market economy in the western world. Prior to the 1930s, the dominant economic philosophy was the classical economic theory. In the 1930s, with the work of John Maynard Keynes emerged the theory and practice of CCFP. The Great Depression led to a thorough examination of the monetary policy as well as fiscal policy at the federal and subnational levels. Scholars found that the federal, state, and local sectors behaved perversely during the Depression because both levels were bound by the requirement to balance the annual budget.^[1]

In 1932, Leland^[2] studied how governments could best meet financial crisis and proposed that “a wise fiscal policy requires . . . a longer term financial program [than the fiscal year] that should take account of the fluctuations of the business cycle and should control the policy of the annual budget.” Leland’s proposal was discussed in 1933 by a University of Chicago roundtable as a method that the federal government could use to balance the budget over economic cycles.^[3]

In 1941, Hansen further expanded this idea. Hansen observed that to promote security for unemployed workers and economic stability during the Great Depression, the federal government at first relied primarily on monetary policy, but the huge number of the unemployed compelled enormous expenditures. Fiscal policy, more by accident than by design, came onto the front stage.^[4] Although an important weapon, monetary policy “has severe limitations and must be supplemented with [fiscal policy, which] includes first a [counter-] cyclically adjusted public spending program and second a [counter-] cyclically administered tax policy.”^[4]

In 1944, Hansen and Perloff extended the argument for CCFP to the state and local sectors: In periods of depression, tax rates should be reduced, and public expenditure should be high by drawing on accumulated reserves and incurring public debt. The policy, in general, shall be directed toward increasing consumer purchasing power and stimulating investment and business activity. For this purpose, tax rates during economic booms should be high to drain off excess consumer purchasing power and to accumulate reserves for revenue shortfalls in the future; public expenditure, in contrast, should be kept low—at a level just adequate to maintain essential social services. Borrowing for further expansion in such periods should be eliminated, and accelerated repayment of public debt should be pursued if the boom is strong.^[1]

Intuitively, the counter-cyclical features of such a fiscal policy make sense, but they are difficult to implement, especially during economic prosperity. Major obstacles may come from three sides. First, states are limited by their constitutions or statutes from

accumulating high levels of surpluses. Even in the absence of legal restraints, individual and corporate taxpayers tend to exert spending pressure on elected officials during booms to expand public expenditures and/or reduce tax rates; and elected officials either share the general optimism or simply follow the voters' will to facilitate their own reelections. Finally, the goals of economic development lead to interstate competition for businesses, which induces, or even dictates, reduction of tax rates.

A subnational government can resort to one or more of the following three means in a recession to implement a CCFP, each with its pros and cons. First, because the federal government has monetary policy and controls more and wider taxing power, federal grants are a valuable financial source. However, obtaining such grants is often unreliable. As experience goes, federal grants may not come as early or at the amount states may need and expect. This lesson was confirmed in the 2001 recession: When the national recession coincided with a catastrophic disaster, federal aid dwindled, and the federal government mandated expenditures that added to states' financial burdens. Besides, where a grant is based on a matching ratio, poor states are hit hard. When a state is in fiscal distress, it often has to cut its assistance to local governments.

The capital market is another means of addressing recession pressures because incurring/increasing public debt in downturns is technically sound. However, recession years are the time when states adopt drastic fiscal measures that adversely affect their credit rating, thus eroding their borrowing capacity on the market. Besides, strict debt limitations as prescribed in state constitutions or statutes do not allow state governments indefinite room for incurring debts.

Then, the only means that is consistently reliable, independent of outside control, is own-source reserves. The availability of reserves depends on two internal factors: first, the legal framework-statutory balanced budget requirements on a (bi)annual basis, which offer little room for flexibility in this context; and, second, the human factor; chief elected officials must possess not only the managerial foresight for the necessity of reserves but also the political courage and skill to resist and manipulate spending pressures during prosperity. Once accumulated, reserves must be guarded against any possible raids in boom years. The best means for counteracting these two internal factors is an institutionalized device that provides statutory protection of the reserves.

The July 1949 "Budget Theory Symposium" dealt with legal framework. Conferees succinctly pointed out that "there is no magic" about the 1-year period of the annual budget; that the most important issue is "stabilization of tax expectance [for businesses];" and that "longer projections and more frequent reviews by the

legislative body are both desirable"^[5] This statement partially softens the theoretical foundation of the annual budget.

Another round of theoretical exploration came in 1987 when Gramlich reexamined macroeconomic evidence and concluded that conventional wisdom may have been inaccurate (states should not only pursue CCFP but, in fact, adopt such practices to stabilize their budgets) and that we can reasonably assume that subnational fiscal policy can exert at least short-term influence.^[6] Gramlich, in 1991, further distinguishes three types of state fiscal policies: neutral, perverse, and stable. The neutral type discourages counter-cyclical policy and advocates automatic fluctuation of taxes and budget surpluses with changes in income. With no counter-cyclical action and no changes to the tax structures over the business cycle, revenues move procyclically. If following a perverse policy, governments would initiate discretionary tax increases and/or expenditure reductions during recessions, cut taxes, and increase spending in boom years. This policy amplifies business cycles fluctuations.^[7]

Gramlich advocates a fiscal policy for stability: Governments smoothen the cycle by raising taxes and/or cutting spending during expansion to accumulate reserves, then by lowering taxes and/or increasing spending during recession by decumulating reserves. The budget would then be balanced over the cycle. This is a stronger version of CCFP, involving accumulating reserves and tax rate changes. No states have adopted this version—although saving reserves are common, tax rate changes, especially permanent ones, are much more difficult and thereby less common because tax increases are politically unpopular. A weaker version without tax changes is what many states have practiced.

THE PRACTICE OF CCFP BY STATE GOVERNMENTS

In the world of administration, New York was the first state to respond to the 1944 Hansen and Perloff proposal by establishing a budget stabilization fund (BSF) to stabilize own-source revenues, with funding from annual surpluses,^[8] but the concept and adoption of BSF spread very slowly among the states until the 1970s. The earliest state BSFs were designed following the weaker version of CCFP—to save annual surpluses in prosperity but not to raise tax rates in boom and then lower the rates in a recession.

Nevertheless, the practice of CCFP had spread out through a wise use of general fund surplus (GFS) accumulated from boom years, evolving the perverse policies of the 1930s into the rational fiscal policies since

World War II. Independent academic research identified this orientation shift in the mid-1960s: "...[T]he patterns of deviations from the trend for state and local receipts were found to have been more and more stabilizing with each succeeding [business] cycle."^[9] A report by the United States Advisory Commission on Intergovernmental Relations (ACIR) in the late 1970s confirms this policy change: "...[D]uring each economic downswing since World War II, state and local fiscal behavior was 'correct' [meaning 'counter-cyclical'] because [spending more from reserves] added to aggregate demand [during downturns]."^[10]

The severe economic and budgetary difficulties of Michigan from 1974 to 1975 and earlier recessions forced the state to seek a permanent solution. Such efforts led to the creation, in 1977, of the Michigan "counter-cyclical budget and economic stabilization fund," which, in comparison with its earlier counterparts in other states, has two new features. First, it places an economic element in the purpose of the fund—to assist in stabilizing not only governmental revenue during periods of recession but also employment when the rate of unemployment is high. Second, the source and use approval of the fund are by a preset formula—the percentage above the 2% annual growth rate benchmark determines the amount to be transferred into the fund in the next fiscal year, and the percentage of negative annual growth rate determines the amount to be used from the fund in the current fiscal year.^[11] The Michigan legislation became a model for many other states. It was "copied" in Ohio, Indiana, and Washington, and it influenced the BSF legislation in many more states. It is not an exaggeration to say that widespread adoption of BSFs among the states started with the 1977 Michigan model legislation accompanied by other social economic factors.

Policy Instruments

Once a CCFP is shown to be rational, state governments face the task of choosing policy instruments that are technically convenient and politically operable while guaranteeing the reserves necessary to handle revenue shocks. The two major ones are the BSF and GFS, although, conceptually, there can be many more possible instruments (some are variations of BSF and GFS in different forms). To practitioners, all forms of reserves, including various contingency funds, can be counted in the BSF category—those that are fine are for one time use and will be returned as soon as the economy recovers. (In fact, the Government Finance Officers' Association (GFOA) lists contingency funds as the same as BSF; see *Recommended Budget Practices—A Framework for Improved State*

and Local Government Budgeting, Section 4.1, Ref.^[12]).

Although we can assume that, in general, economic differences between BSF, GFS, and other forms of reserves do not exist—because total cash position at times of a budget shortfall is the issue^[13,14]—it is important to remember that because budgeting is always closely related to politics, the real test for the above assumption is whether elected officials, and taxpayers collectively, can "administratively and politically" exercise adequate fiscal self-restraint on a routine basis in times of expansion^[15] (i.e., to protect fiscal reserves against current spending pressure for use in a subsequent downturn).

From 1946 to the mid-1980s, the adoption of BSFs among the states was very slow; most states relied on GFS as the policy tool, and even with those states with a BSF, GFS was an indispensable supplement. In the late 1970s, the "tax and expenditure limitation movements," starting with Proposition 13 in California, rapidly spread to other states. A direct consequence of these movements was a strict limit on general fund balance levels. GFS levels plummeted in states with such a limit. In the course of these movements came the severe national recessions of 1980 and 1982, which repeated in state legislatures and state governments, in general, the historical lesson of the chaos that may ensue when inadequate reserves are on hand to ameliorate sudden revenue shocks. Thus the tax and expenditure limitation movements and the recent recessions became the driving force and catalyst in the wider adoption of BSF, triggering a chain reaction among the states. Soon, over a dozen states passed BSF legislation.

The lesson can be best summarized with a quote from the 1981 State of Washington legislation for their "emergency reserve fund:" "The current budgetary system of Washington lacks stability. It encourages crisis budgeting and results in cutbacks during lean years and overspending during surplus years." To safeguard the fund against raids, a very strict procedure was put into place: Appropriations from the fund can be made "only if approved by two-thirds of each house and by a vote of the people at [the] next general election." (Revised Code of Washington 43.135.045)^a Historical data show the shift of state fiscal reserves from GFS to BSF—although the historical average balance of BSFs has increased from the early to the more recent ones, the historical average level of GFS has tended to decrease.

^aRevised Code of Washington, Title 43: State Government—Executive, Chapter 43.135: State Expenditures Limitations (formerly Tax Revenue Limitations), Section 045: Emergency Reserve Fund.

Response from the Congress, Market, and Professional Organizations

Adoption and implementation of CCFP by the states have been welcomed and encouraged by legislators, the debt market, and professional organizations. In 1985, the United States Congress concluded that “the states believe there is a role for [state] government in countering recession, irrespective of Federal action.” Three design issues are prominent: first, state reserve funds have to be large enough to buffer revenue shocks in a recession. There is no uniform level of the reserve proper to all states. The level varies by each state’s cyclical economic fluctuation; second, states need a policy of maintaining reserves of a given size to avoid year-to-year debates about the proper size; and, third, the accumulation and release of reserves should be gradual.^[16]

In 1990, research by the GFOA argues that establishing a fund balance policy and the BSF can alleviate sudden short revenue shocks or deficits.^[13] GFOA advocates CCFP and lists it as a best practice.^[12] Credit rating agencies claim that “maintaining an operating reserve is the most effective practice that can enhance an issuer’s credit rating” and lists it as the first of 12 best practices that have “significant rating value.”^[17] Thus CCFP at the subnational level in the United States has been widely accepted and adopted.

THE FUTURE OF CCFP

In the field of macroeconomic theory, the debate about the stabilization policy is yet to conclude. Some economists hold that variations in governmental revenue flows are caused by a combination of multifactors. Fluctuations in the economy (recession and expansion) are but one of them. Others are changes in the tax structure, additions or discontinuations of taxes, and raising or reducing of tax rates, which are results of not only the economy but also, and more often, election politics.^[18] Because monetary and fiscal policies can influence these fluctuations and offset shocks, policy makers should act to stabilize the economy to keep output and employment close to their natural rates.

However, some other economists doubt whether the government is able to stabilize the economy. On one hand, between the recognition of a recession for state governments and the start of counter-cyclical fiscal programs, there are long and variable lags that are inherent in economic policy making. On the other hand, our understanding of the economy is still very limited and economic forecasting has repeatedly failed our expectations. Therefore it may not be a bad idea for policy makers simply to passively follow a fixed policy rule.

A more seemingly convincing argument about CCFP goes that: assuming stabilization could be

successfully achieved, by the natural rate hypothesis, such a policy can only reduce the magnitude of fluctuations around the natural rate by eliminating the peaks of booms as well as the troughs of recessions so that the average benefit would be small.^[19] Finally, the real-business-cycle theory takes fluctuations as the optimal response of the economy to changing technology, and believes that even if stabilization were possible, policy makers should not pursue this goal.

A direct answer to such doubts is straightforward: Drastic fluctuations of state budgets in history have caused, and will again cause, huge damage and interruption to public life. Revenue shocks from business cycles have repeatedly shown that the subnational sector is prey to economic fluctuations. Public expenditures should not be as subject to cyclical fluctuations as private investments.^[20] Therefore, stabilization of state budgets is a big public good, which is worth every effort to achieve. Scholars and practitioners have also been calling for CCFP for decades. The tide has been rising with recessions and ebbing with expansions—the lesson is still not thoroughly learned.

CONCLUSION

However, a rational fiscal policy and proper policy tools are not a panacea to governmental revenue shocks. The policy and policy tools are but the means that must go through the human hands of implementation to be effective, which in turn lies ultimately in the domain of politics. Specifically, a wise fiscal policy may be brushed aside; appropriate policy instruments can run distorted; and fiscal reserves that are adequate by the most sophisticated formula might as well be used off the right target. Therefore, the solution returns to the very basics of fiscal restraint and budgetary discipline. It would be a misconception that a rational policy can solve the problem once and for all.

Supplemental Appropriation

Jerry McCaffery

*Department of Systems Management, Naval Postgraduate School,
Monterey, California, U.S.A.*

INTRODUCTION

Supplemental appropriation bills provide funding supplements for the current fiscal year already in progress, over and above funding provided in the regular appropriation bills. Supplementals normally fund disaster relief efforts, emergent military needs unforeseeable in the normal budget process, and occasional emergency economic relief. At the federal level, supplementals usually provide budget authority, which is then committed to programs by obligations. The actual outlay or spending of that money may occur over a longer period than the year for which the appropriations were made. Supplementals are used at all levels of government in the United States. At state and local levels, supplementals usually are passed in the current year and spent out in the current year. In some instances, a supplemental appropriation may become part of the ongoing funding for an agency; usually, however, supplemental appropriations are for specific one-time purposes of an emergency nature.

Before the passage of the Congressional Budget and Impoundment Reform Act of 1974, supplementals were “regularly used to provide funding for day-to-day agency operations,” such as pay raises for federal employees; but, in the recent years, supplementals “have been mainly used to provide funding for unanticipated expenses—although there is sometimes an argument about the whether the requirements should have been anticipated or not.”^[1,2] Supplementals mirror the complexity of the normal budget; they may be spent for agency programs or go directly to individuals, domestically or abroad. They may support direct actions for disaster relief, such as road and bridge building and other infrastructure repair, or they may fund a variety of disaster relief credit and loan programs administered by various federal agencies. States and local governments have come to count on federal government leadership and financial participation in disaster relief and may underbudget from their own funds for these purposes. At the federal level, recent attempts to offset some supplemental costs with rescissions has meant that, while supplemental bills increased funding for some programs, others were decreased, not supplemented. Moreover, recent attempts to hold to spending caps and balanced budget

agreements may have resulted in slight but purposeful underfunding of some of the normal appropriation bills with the difference made up later in a supplemental bill, deemed either a “dire emergency supplemental” and thus beyond any spending cap or offset by a rescission in someone else’s program. The federal government has a long history of using supplementals, and the latter argument over use of supplementals to escape fiscal discipline in the normal appropriation process is not new.

HISTORY

Supplemental spending bills are not new. Supplementals began with the second session of the First Congress in 1790^[3] and were commonly used in the early 1800s. They frequently included additional appropriations for agencies that had overspent their appropriations and, as such, became known as deficiency appropriations. This practice became so routine that the House Appropriations Committee divided them into “general deficiency” bills and “urgent deficiency” bills. In the 1870s when antideficiency legislation was passed, critics of this process accused Congress of underfunding the regular appropriations bills so they would appear to be frugal stewards of public funds, and then, “after elections were over, make up the necessary amounts by deficiency bills,” according to James Garfield, chairman of the House Appropriations Committee in 1879.^[3] The Antideficiency Act of 1905 attempted to control deficiency spending by giving the Treasury Department the authority to apportion funds to agencies to reduce the need for supplementals. This power was further refined by the Budget and Accounting Act of 1921 and the Antideficiency Act of 1950. These revisions limited supplemental appropriations to legislation enacted after the president’s budget had been submitted and for emergencies relating to the preservation of human life and property.

The issues surrounding supplementals have remained contentious. Aaron Wildavsky identified the strategy of “coercive deficiency,” in which an agency would overspend its appropriation secure in the knowledge that Congress would provide supplementals. This strategy was primarily effective for popular agencies

and programs; in the late 1800s, examples of this coercive deficiency can be found in the practices of agencies helping to open up the West through mapping and transportation infrastructure. The strategy was also based on good relationships between Appropriation Committee chairmen and the agency heads; agencies without such relationships or such popular programs could not count on this strategy.^[4] In 1966, the Joint Committee on the Organization of Congress again raised the issue of lawmakers projecting an image of economy by underfunding the regular appropriation bills with the tacit understanding that they would later pass supplemental appropriation bills.^[3] The Congressional Budget and Impoundment Control Act of 1974 also attempted to control the use of supplementals, by providing that expected supplementals be included in the president's budget and that an allowance be set aside in the budget resolution for anticipated supplementals. While these tactics have not been particularly helpful, Congress and the president have tried to offset supplementals with rescissions or cancellations of budget authority provided in earlier appropriations bills that has not been obligated or has been deemed unnecessary. An examination of the 1990s shows that rescissions have made an impact on supplementals, but only in 1995 were rescissions large enough to offset supplementals. In fact, in that year, rescissions were more than the amount appropriated for supplementals.

SUPPLEMENTALS AND BUDGET FORMULATION

Normal budgetary procedures require that budget or appropriation bills be passed before the beginning of the fiscal year, although, in practice, debate over what and how much to fund often results in the passage of these bills after the fiscal year has begun. In contrast to regular appropriation bills, supplementals are quite small as a percentage of the total budget and often result from emergency situations unforeseen in the normal budgetary process that require immediate funding. Customarily, the federal budget process takes 18 to 21 months to complete from the time when agencies begin drafting their budgets (e.g., March 2002) to the time when the president signs the resulting appropriations bills (e.g., legally by October 1, 2003, but usually in November). No such lengthy process could possibly cope with unexpected and unanticipated events. Supplemental appropriation bills provide funding to meet such suddenly emergent needs in the United States and abroad. These bills adjust current year funding levels. They may provide for natural disaster aid to states, regions, and directly to individuals for blizzards, floods, drought, fires, and hurricanes. Supplementals

helped out in the northeast blizzard of 1978; the Mount St. Helens eruption in 1980; Hurricane Hugo and the Loma Prieta earthquake in 1989; Hurricanes Andrew and Iniki, the Chicago flood, and the Los Angeles riots in 1992; the Northridge earthquake in 1994; and flooding in the Dakotas in 1998. Supplementals met emergent military missions in the 1990s beginning with the Gulf War in 1991 and Bosnia in 1996 and thereafter.^a Funds from supplementals have been spent both inside and outside the United States as policy makers have reacted to events suddenly thrust upon them.

SUPPLEMENTALS AND AGENCY BUDGET EXECUTION

Agencies have a certain amount of flexibility in the way they administer their budgets. Congress officially recognized the need for agency discretion in budget execution since the growth of federal expenditures after World War II. Jones and Bixler suggest that the 1956 Defense Appropriations Bill expressed congressional policy on reprogramming that still remains in force.^[5] The report attached to the bill stated that there would always be some unforeseen changes in operating conditions and circumstances in the interval between building and presenting the budget and executing it. These might include changes in operating conditions, revisions in price estimates, wage rate adjustments, and so on. Consequently, rigid adherence to the original budget might prevent the effective accomplishment of the planned program. The report cautions that it was not the intention of Congress to give the military departments unrestrained freedom to reprogram or shift funds from one category or purpose to another without prior notification and consent from Congress. Since 1959, Congress has emphasized prior approval before implementation of certain transfers, certain threshold requirements, and periodic reporting on issues of special interest to Congress. In 1974, Congress added a restriction that prohibited the Department of Defense from transferring funds to restore budget items specifically denied by Congress. However, supplementals are aimed at a different class of actions, namely emergencies arising within the fiscal year where expenses are large enough to warrant the appropriation of additional funds and where the legislature may need to authorize that the mission is something

^aFor the definitive analysis of Supplemental Appropriations, see the series of reports issued by the Congressional Budget Office, Budget Analysis Division, including Supplemental Operations in the 1970s (July 1981); Supplemental Operations in the 1980s (Feb. 1991); and Supplemental Appropriations in the 1990s (March 2001). The most recent version may be found on the Congressional Budget Office web page: www.cbo.gov

that should legitimately be carried out by agents of the U.S. government. Thus, supplemental needs may be too large to accomplish with agency fund transfers or reprogramming. Moreover, they may cross agency and jurisdiction lines and respond to new needs outside the mission of any one agency or, indeed, outside the United States. If an agency were to reprogram or transfer funds to meet this new need, it would not have the money to fulfill the missions it had been given in its appropriation bill. In that sense, it would be breaking a promise to Congress; thus, in addition to provision of funds, a supplemental bill also legally sets the new programs or tasks as a legitimate mission of the government and the agencies affected. Thus, a supplemental is about both dollars and policy.

Nowhere is this more apparent than in the defense policy area. The failure to fund certain military assistance needs in a supplemental in April 1975 came at a time when Saigon was falling and was a signal to the world that the United States would pursue no further military aims in Vietnam. Conversely, the three supplementals for the Gulf War in 1991 and for peacekeeping operations in Bosnia beginning in 1996 were clear signals of U.S. interests and intentions. Within the last decade, supplemental appropriations have funded wars, supported peacekeeping operations, responded to terrorist attacks, and helped various disaster victims both in the United States and abroad. Supplemental appropriations allow for both concrete help and a symbolic expression of policy. A supplemental passed to aid flood victims in Central America or for peacekeeping reminds everyone of the purposes to which the U.S. government is willing to commit both its treasure and its people.

STATE PATTERNS

States also have to meet emergencies. In testimony before Congress, Theresa Gullo of the Congressional Budget Office reported on state practices.^b In general, states plan to meet two types of fiscal emergencies: economic downturns and natural disasters. Gullo reported that most states have created budget stabilization funds (usually referred to as Rainy Day funds) to meet a weak economy. These may be used for a variety of purposes but only in times when revenues fall short of expectations. Gullo observed that when faced with an unexpected decline in revenues or an increase in spending needs, 44 states used their budget stabilization

fund to tide them over. Normally a vote of the legislature precedes spending the funds. Rainy Day funds are rarely used to pay for natural disasters or other types of emergency needs. Randall Holcombe notes that Rainy Day funds have been successful in mitigating some of the aspects of fiscal stress, but a Rainy Day fund that would completely eliminate any negative impact from a recession like that in 1990–1991 would have had to have been about one-third the size of a state's annual budget; Holcombe observes "No state has ever had a rainy day fund anywhere near this large and many cap their funds at much lower levels."^[6] Holcombe concludes that Rainy Day funds are not large enough to avert depressions but do provide states with a cushion going into a recession so that they have some additional time to adjust their spending patterns. For natural and man-made disasters and other non-fiscal emergency needs, states establish a variety of contingency and emergency accounts. Gullo noted that Maryland had both a Contingent Fund and a Catastrophic Event Fund. The Contingent Fund was established by the state constitution and was used when an agency's annual appropriation was insufficient to cover salaries and operating expenses. The Catastrophic Event Fund, established by statute, held funds to meet natural disasters and other emergency situations.^b

Gullo found that state legislatures typically appropriated small sums ranging from a few hundred thousand to several hundred million dollars to emergency-response accounts. Generally when a disaster occurs, the governor declares a state of emergency and requests a supplemental appropriation from the legislature. This appropriation is drawn from the disaster fund. This procedure allows the state legislature to maintain control over the total amount spent for disasters, while the governor is given the discretion to decide how and when that money is spent. Occasionally, a governor has the emergency authority to bypass the legislature entirely and borrow from almost any other state budget account. Gullo found that Idaho, Florida, and Virginia empowered their governors to transfer all unobligated resources of all state agencies to the emergency account to address a disaster. Usually, governors must go to the legislature for supplemental sums of money. Gullo noted that in 36 states, the governor authorized the use of emergency funds, often after declaring a state of emergency (or after a federal emergency was declared). She observed that South Carolina and Ohio had established emergency councils that made decisions about how to allocate appropriated funds for emergencies and that Oregon was almost alone in placing authority for spending for emergencies solely with the legislature and in an emergency board of legislators when the legislature was not in session.^b Other states used some combination of

^bTestimony of Theresa A. Gullo, Chief, State and Local Government Cost Estimates Unit on "How States Budget and Plan for Emergencies" before the House Budget Committee on June 23, 1998. Discussion of state practices is largely drawn from this testimony.

executive and legislative authority. Gullo concluded that states count on the federal government to step in during a large scale emergency and their goal is to have sufficient funding in their emergency account to provide any required state match for federal disaster assistance. States also use their emergency money to get disaster relief and recovery planning started as soon as an emergency occurs, so that disaster relief and recovery efforts can be carried out expeditiously when federal money becomes available.

CONCLUSION

Supplementals in the 1970s and 1980s were biased toward the mandatory expenditures but have been dominated by defense and disaster expenses in the 1990s. Some attempt has been made to offer up offsetting rescissions in the 1990s, but a full offsetting of supplementals has been rare. Nonetheless, the use of rescissions means that appropriations for an agency may actually be decreased in a supplemental bill if it has a program that is offered up in a rescission to support supplemental funding in another agency or program. Moreover, the necessity to find offsetting funds or designate funding as “emergency” has led to an increase in the use of that designation; as a result, not only do emergency designations appear in supplemental bills, but the emergency designation has slipped into regular appropriations bills, so that now some regular appropriation bills have emergency funding within them as do some supplementals. Moreover, sometimes the emergency funding lasts for more than one year, thus the supplemental with emergency funding could affect not only this year but the next year.

This tends to confuse an already complex budget process and critics suggest the second year of emergency funding should be included in the regular appropriations bills. Others observe that when spending caps are set unrealistically low, spending is deemed “emergency spending” simply to get around the caps and that more realistic caps would lead to less emergency spending. Supplementals have been an issue since 1790, but they are not a big issue. However, their symbolic importance is dramatized by the size and speed of the passage of the supplemental in response to the attack on the World Trade Center of September 11, 2001. Whatever their limitations and complexities, supplemental appropriations must be seen as part of the full panoply of budgetary tools any modern government must deploy.

INTRODUCTION

Sustainable development is the term used to refer to the idea of simultaneously improving societal economic well-being, protecting the resilience of the natural environment, and addressing inequities in the distribution of power and wealth. A consensus on a precise definition of sustainable development has eluded the international policy community despite a decade and a half of intense debate. But the working definition with the greatest currency is the one advanced by the 1987 final report of the World Commission on Environment and Development^[1] commonly referred to as the Brundtland Commission after its chair, Norwegian Prime Minister Gro Harlem Brundtland:

Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. It contains within it two key concepts: the concept of 'needs,' in particular the essential needs of the world's poor, to which the overriding priority should be given; and the idea of limitations imposed by the state of technology and social organization on the environment's ability to meet present and future needs.

As Rao^[2] notes, most references to the Brundtland definition refer only to the first sentence and so are "less than fair to the spirit of the original contributors." He considers this a critical omission in that the second sentence qualifies the first in an important way, as the first sentence in isolation tends to emphasize intergenerational over intragenerational equity. Says Rao, "It is rather naïve to believe that [sustainable development] can be viewed as a meaningful approach when it is formulated totally independent of income distribution policies."

This analysis of the Brundtland Commission's definition represents the concept of sustainable development in its broadest sense and, as such, is an appropriate base from which to explore the debated meaning of the term. The scholarship of Desmond McNeill provides the foundation for first understanding

sustainable development as a phenomenon of conflict and then in sketching a "structural analysis" of the debate surrounding its meaning. We will consider some dissenting views, and we will conclude with an assessment of the sustainability of the concept of sustainable development itself as "an idea in good currency" to use Donald Schon's phrase.

A STRUCTURAL ANALYSIS OF THE DEBATE

McNeill's^[3] view of sustainable development focuses on the "potential conflict" with which the term is pregnant. Of the theaters of conflict described by McNeill, we focus on three: between present and future generations, between humanity and the rest of nature, and between the rich and poor of the current generation. At issue are three sets of objectives, best illustrated by the Environmentally Sustainable Development triangle (Fig. 1).

McNeill argues that the Brundtland process was a "remarkably successful agenda-setting exercise" that effectively solved "a perceived dilemma between growth and the environment." In effect, the Brundtland Commission partially succeeded in superceding two long-standing conflicts related to development and the environment by redrawing the lines of "cleavage" between the camps. This strategic alteration of the scope of conflict is consistent with E. E. Schattschneider's description of the mobilization of bias.^[4] Interpretation of the process helps us understand the lingering debate about the meaning of sustainable development: The lines are no longer as clearly drawn among the warring camps as they were prior to the introduction of the sustainable development concept. As McNeill notes, the Brundtland Commission's relative success in fusing the dynamics of the two debates into the "sustainable development debate" was hamstrung by the use of less specific language necessary to achieve a consensus among the contributing authors. McNeill offers a highly useful "structural analysis" of the sustainable development debate and the origins of the specific issues from the two debates it replaced (Fig. 2).

McNeill may be overly modest in fretting about whether the “lines of fission” of the two debates “map” cleanly to the sustainable development debate. As he insightfully notes, the coherence of the debate of the third column as a viable alternative to the two separate debates is central to the dispute over the meaning of sustainable development. The future viability of the sustainable development debate depends on the veracity of the claims that the three competing sets of objectives can be simultaneously achieved.

DISSENTING VIEWS

Ecology

Scholars and policy partisans each have brought a wealth of critiques to the debate surrounding sustainable development. Many scholars have focused on the contributions of the various disciplines. Rao, for instance, emphasizes the specific contributions of the science of ecology to the Brundtland definition.

Specifically, Rao argues that the reference to environmental limits within the context of prevailing technology or institutional arrangements is a factual characteristic of the non-linear nature of ecosystems rather than a neo-Malthusian condition of resource constraints. On this point, Drummond and Marsden^[5] writing from the perspective of academic urban planners, are quite critical. They argue that the debate must “move beyond the somewhat naïve conceptions of a ‘resource crises’ engendered by such publications as ‘Limits to Growth’^[6]...The requirement for such limits may appear to be intuitively obvious and a practical necessity, but the utility of any approach to sustainable development...is highly questionable.”

Economics

The discipline of economics can also be credited with vital contributions to the sustainable development debate. An environmental studies generalist, Paehlke^[7] provides great value to the enterprise of defining sustainable development by tackling the imprecision of

Fig. 2 Structural analysis of the sustainable development debate. (From Ref.^[3].)

the language involved in the debate. He differentiates sustainable development from sustainability, defines several applications of sustainability as an idea, and then argues that facilitating greater precision in the language used should be high on the agenda for researchers and policy partisans alike.

Paehlke, in differentiating sustainability from sustainable development, does so in full recognition that “sustainability as a concept travels with somewhat less political baggage” as many “environmentalists see sustainable development as an oxymoron, little more than political cover for otherwise unacceptable corporate environmental practices.” This insight defines quite precisely much of the tenor of the dissent voiced by partisans in the sustainable development debate. To some extent, this relates to the relative success of the sustainable development debate to supplant the development and the environmental debates. Dobson^[8] gives voice to this skepticism by concluding that “for those whom the defense of the non-human natural world is a prime consideration need to pick and choose their political allies with care.” But environmental activists aren’t alone in their skepticism. Poverty advocates, antiglobalism activists, and social justice organizations have demonstrated ample skepticism of sustainable development. As McNeill notes, “Global warming is certainly not a priority issue for many of the poorest people of the world, but it does in many ways exemplify the challenge—practical, ethical, and political—posed by the concept of sustainable development.”

IMPLICATIONS FOR PUBLIC ADMINISTRATION

The challenge for public administration scholars is to subject the claims of sustainable development to rigorous testing. Some commentators have pronounced certain approaches to environmental management as capable of achieving sustainable development, but they do not back the claims with credible evidence. For example a much-cited report by the Institute of Southern Studies^[9] draws this conclusion based on a positive correlation between state environmental regulation efforts and personal income. Most studies do not provide systematic explanations for *how* trade-offs between environmental quality and economic growth are overcome, nor do they subject their hypotheses to rigorous empirical tests. Recently Feiock and Stream^[10] applied a transaction cost approach to critically examine claims of sustainable development. The challenge for public administration practitioners is to promote sustainable

development but not apply sustainability as a label or symbol to legitimize certain policy agendas.

The Sustainability of SD as an Idea

Ultimately the “sustainability” of sustainable development as an idea in good standing will depend upon its successful implementation. Many observers have pointed to a political agreement for the global control of greenhouse gas emissions as the first test case for implementing a sustainable development approach. Given that the Kyoto Protocol called for graver restrictions on the developing countries has been seen as evidence of a growing world consensus that the developed countries must assume a greater share of the costs of global environmental protection initiatives. Such projects will have to demonstrate that economic development can create more just human societies without negatively impacting the environment. Perhaps implementing sustainable development will prove less contentious than defining it.

Tax Expenditures

Iryna Illiash

*Graduate Department of Public Administration, Rutgers University,
Newark, New Jersey, U.S.A.*

INTRODUCTION

Tax expenditures are reductions in tax liabilities that result from preferential provisions in the federal tax code, such as special exclusions and exemptions from taxation, deductions, credits, deferrals, or preferential tax rates. Tax expenditures include revenue losses for the income tax, the estate and gift taxes, as well as payroll and excise taxes.^[1] Table 1 provides a list of the 20 largest tax expenditures in federal income taxes.

As special provisions, tax expenditures are treated as deviations from the normal tax structure. Theoretically, a provision is structural if it exists to accurately estimate income. In practice, however, there has been continual disagreement among tax experts about what to consider a “normal” structural provision and what not. So far only personal exemptions, standard deductions, and guaranteed individual rates are universally recognized as part of the normal structure.^[2]

The underlying assumption behind the concept of tax expenditures is that the tax system is not just the means of raising revenue, it is an important tool used to accomplish a variety of objectives of public policy. The term “tax expenditure” is meant to express the idea of government subsidy through the tax system, parallel to direct government spending, with a view to influence particular kinds of economic and social behavior of both individuals and corporations and to encourage certain investment (by increasing the after-tax returns) and consumption (by reducing the after-tax cost of particular goods and services) activities in order to provide economic relief to selected groups of taxpayers and consumers. The criterion for such subsidizing is a choice of activities that further economic, cultural, and social objectives of the entire society, not just confer benefits on those individuals or corporations who are directly engaged in the activity. Basic research, experimentation investment, health care consumption, or charitable giving are the examples of such activities. The rationale behind such subsidizing is that individual taxpayers or businesses alike, if they do not capture all benefits themselves, would undertake too little of the activity in the absence of a subsidy.^[1]

PURPOSE

Whatever the purpose, all tax expenditures invariably favor certain selected groups and activities. Some tax expenditures provide for adjustment for differences in individual’s ability to pay taxes. For example, if two taxpayers have the same income, but one has a serious illness and costly medical bills, the other taxpayer is considered better able to pay taxes on his income. Some tax expenditures, such as the Low-Income Housing Tax Credit, are designed to mimic the features of a direct spending program, others, such as deductions for charitable contributions or home mortgage interest, are attributed to the American tradition and the way of life.^[3] There are also tax expenditures believed to compensate for the deficiencies of the tax system. For example, the special tax treatment of capital gains is justified on the grounds that they are not indexed for inflation.^[1]

One of the most thorough classifications of tax expenditures belongs to Witte. He believes that tax expenditures should be classified in such a way as to help shape the theoretical issues central to tax debates. Therefore, his classification is based on the distinctions between need, equity and economic efficiency of tax expenditures.^[4] It includes the following six categories summarized in Table 2: need-based provisions, tax equity provisions, special group benefits, general economic incentives, specific economic incentives, and miscellaneous provisions.

Tax expenditures are considered inefficient when they subsidize an activity that could be undertaken in the absence of a subsidy, or when they cannot be traced down to those entities that are meant to receive the benefits.

HISTORIC OVERVIEW

Although tax expenditures have entered the political debate quite recently, largely due to the attention to the problem of the federal budget deficit, they have existed almost as long as taxes. The home mortgage interest deduction, introduced into the tax code in 1913, became the first tax expenditure. It was followed

Table 1 The twenty largest tax expenditures in federal income taxes fiscal years 1998 and 1998–2002 (billions of dollars)

Tax expenditure item	1998	1998–2002
Exclusion of employer contributions for medical insurance premiums and medical care	75.8	435.7
Net exclusion of pension contributions and earnings	56.2	285.4
Deduction of mortgage interest on owner-occupied homes	52.1	284.8
Exclusion of capital gains at death	32.0	173.0
Deduction of state and local income and personal property taxes	40.0	169.0
Accelerated depreciation of equipment	29.3	176.0
Deduction of charitable contributions	22.3	123.4
Exclusion of Social Security benefits	18.5	100.3
Deduction of property taxes on owner-occupied homes	17.4	95.3
Exclusion of interest on public purpose state and local debt	15.7	77.2
Deferral of capital gains on home sales	15.3	81.2
Exclusion of interest on life insurance savings	11.9	68.0
Exclusion of interest on state and local debt for various private purposes	8.9	42.4
Net exclusion of Individual Retirement Account contributions and earnings	8.6	45.5
28% maximum rate on capital gains (other than agriculture, timber, iron ore, and coal)	8.5	45.0
Earned income credit ^a	5.8	31.7
Exclusion of worker's compensation benefits	5.3	29.6
Exclusion of capital gains on home sales for persons age 55 and over	5.1	27.2
Graduated corporation income tax rate	4.9	27.2
Accelerated depreciation of buildings other than rental housing.	4.7	13.2
Deduction of medical and long-term care expenses	4.3	26.5

^aThe figures in the table indicate the effect of the earned income credit on receipts. The effect on outlays (in billions of dollars) is 22.0 in 1998 and 118.8 for 1998–2002.

Note: These estimates do not reflect the effects of the Taxpayer Relief Act of 1997.

Sources: From Refs.^[3,17].

by the adoption of tax expenditures for employer pensions (1914–1926), employer-provided health benefits, and for child-care expenses (1954).^[5] In the 1960s, Stanley S. Surrey, assistant secretary of the Treasury for tax policy in the Kennedy and Johnson Administrations, developed the concept of “tax expenditures” and a related concept of the tax expenditure “budget” to raise awareness about the existence of tax subsidies and to facilitate their comparison with direct government outlays.^[1] The first Tax Expenditure Budget was released in 1969. Since then, it has been published annually as a special appendix to the federal budget and organized according to functional policy areas, such as energy, natural resources, income security, etc. The first “official” definition of the term “tax expenditures” appeared in the Congressional Budget and Impoundment Control Act of 1974.

A significant attempt to curb the growth of tax expenditures was made in 1986. The major thrust of the 1986 Tax Reform Act was to offset tax rate reductions by eliminating hundreds of billions of dollars of tax expenditures. The act repealed 14 tax expenditures and scaled back 16 others. In 1990, the Budget Enforcement Act reduced the historical advantages of

tax expenditures even more through placing absolute caps on discretionary spending.

The Government Performance and Results Act of 1993 raised the issue of assessing the relationship between spending programs and related tax expenditures, thus focusing attention of the political community on a possible trade-off between these policy tools. Finally, the 1997 Taxpayer Relief Act signified the rebirth of tax expenditures by creating new, and expanding already existing, tax subsidies.^[3]

PRESENT-DAY ROLE

The proliferation of tax expenditures is believed to be closely linked to the current transformation of the public sector driven by government downsizing, privatization, and contracting out. These processes have turned the government from the provider of public services to the purchaser of such services. They have also changed the structure of government finance. Tax expenditures result from the fact that nowadays the spending mostly occurs not within but outside the government.^[6]

Table 2 Witte's classification of tax expenditures

Category	Provisions	Description	Who benefits
Need-based provisions	Exclusions of Social Security (OASI, survivor's benefit and disability payment), workmen's compensation, unemployment benefits, veterans' disability payments, public assistance, capital gains on home sales of the elderly, railroad retirement, military disability, disability pay, and of coal miners' disability benefit; deduction of medical expenses, casualty loss, and of adoption expenses; additional exemption for the elderly and for the blind; earned income and retirement tax credit; exemption of students over 18; and excess of percentage over minimum standard deduction	Provisions in this category are designed to take into account presumed economic needs, such as conditions imposing restraints on income-earning potential, extraordinary expenses, situations of economic hardships, and conditions affecting the elderly.	Mostly low-income but also middle-income groups
Tax equity provisions	Deductions of state and local taxes, real estate taxes, state gasoline tax, and deductions for two-earner couples; exclusions of state and local bond interest and of employer-furnished meals and lodging; child-care credit; and deferral of taxes on foreign corporate income	These provisions are designed to either eliminate taxes on taxes or take into account expenses incurred while earning income.	Middle- and higher-income groups
Special group benefits	Exclusions of military benefits, veterans' pensions, reinvested utility dividends, certain agricultural cost sharing; capital gains for timber income and for certain farm income, as well as capital gains on coal and iron ore royalties; expensing of farm capital outlays; excess bad debt for financial institutions; deferral of tax on shipping companies, exemption of credit union income.	Provisions of this category must meet the following criteria: 1) The provision affects a reasonably permanent and identifiable demographic or occupational group (This criterion applies a restrictive definition to the concept of a group delimited by three tests: whether the "group" has formal organizations or associations, whether its members have common identifications, and whether the membership in the group reflects a relatively permanent condition); 2) The economic conditions addressed by the provision cannot be assumed to be exclusive to that group (This criterion gives concrete meaning to the term "special"); 3) There is no indication that the benefit is being granted primarily on other grounds.	Low-income as well as some higher-income groups

(Continued)

Table 2 Witte's classification of tax expenditures (*Continued*)

Category	Provisions	Description	Who benefits
General economic incentives	Investment credit, capital gains, asset depreciation range, research and development benefits, dividend exclusion, excess first-year depreciation, all savers certificates, etc.	The provisions in this category are meant to induce investment and to enhance economic growth.	Almost exclusively higher-income groups
Specific economic incentives	Exclusion of interest on life insurance, on industrial development bonds, housing bonds, pollution control bonds, student loan bonds and on savings bonds; deduction for mortgage interest, deduction of charitable contributions, such as to health organizations or for education; exclusions of self-employed contributions to pensions, exclusions of scholarship and fellowship income; deferral of capital gains on home; credits for residential energy expenses, for new energy technology and alternative fuels, for political contributions; tax credit for corporations in U.S. possessions, investment credit for employee stock ownership plans, general and targeted jobs credit, investment credit for housing rehabilitation; and benefits for preserving historic structures	The purpose of these provisions is to encourage specific forms of desirable behavior other than general economic investment. Distinguishing between category V and category III involves the nature of organized interests and the consideration whether the provision is designed to aid a group or to induce a specific activity.	Middle- and upper-middle-income groups
Miscellaneous provisions	Deduction of interest on consumer credit, safe harbors leasing, exclusions and deductions for income earned abroad, and maximum tax on personal services "earned" income	This category contains those provisions that cannot be easily placed into any of the other categories.	Middle- and higher-income groups

Source: From Ref.^[4].

CHARACTERISTIC DYNAMICS AND PROBLEMS

The concept of tax expenditures is controversial as it involves some perceptually difficult issues. One of the conceptual difficulties, mentioned earlier, is caused by the attribute "special" used in the definition of tax expenditures. It leaves room for arbitrary judgment as to what should be considered the tax expenditure.

Another difficulty arises from the semantic ambiguity of the term "tax expenditures" itself leading to different interpretations of its meaning. Thus, according to the conservative view, the term implies that all income inherently belongs to the government, and only government's generosity allows people to keep income

they produce.^[4] On the other hand, the progressive view indicates the recognition that tax expenditures are, effectively, part of the overall budget process^[7] and as such, are analogous to programs on the expenditure side of the budget.

However, contrary to direct spending programs, tax expenditures have low visibility, as they do not require the allocation of actual funds. They are, in fact, the funds not collected by the government. For this reason, tax expenditures do not receive the same degree of congressional scrutiny as direct spending.^[8] Tax expenditures are immune from the annual appropriations process and not subject to any mechanisms of audit, oversight, or systematic review.^[5] At the same time,

they reduce the government's resources in the same way as regular spending does. Tax expenditures often match and sometimes exceed direct expenditures in size. For example, in 1998 the federal government financed more programs through the tax code than through the regular appropriations process.^[2] The low profile of tax expenditures allows policy makers to achieve a variety of goals by discretely allocating tangible benefits outside of the budget process.^[9]

The main cause of "the structural protection" of low visibility, according to Meyers, is the inherent difficulty of measuring tax expenditures.^[8] Unlike most direct expenditure programs, tax expenditures are open-ended as to the amounts involved.^[10] Also, as Perry indicates, the estimate of revenue forgone due to tax expenditure provisions cannot be directly translated into tax revenue gained as a result of the elimination of those provisions. First of all, tax expenditures are the incentives targeting taxpayers' behavior, therefore this behavior will change in the absence of the benefit. For example, employees might become reluctant to accept employer-sponsored health insurance if its cost is included in taxable income. Secondly, a tax expenditure and a direct spending program with the same objective may allocate benefits to different target populations. For instance, old age security pensions provide assistance to senior citizens with little or no other income, while the pension tax credit benefits those with taxable income. Finally, a tax benefit can be more valuable to an individual in terms of real money than the same amount of direct (and taxable) payment.^[11]

Because tax expenditures in general are not subject to congressional review, their growth is uncontrollable. The tax expenditures system has proliferated at a much more rapid rate than the gross national product, federal outlays, or income tax receipts. From the mid-1960s to the early 1980s, the number of tax expenditures increased almost fivefold, which allowed Meyers to conclude that they had become the preferred tactics of the period.^[8] In 1993, there were 124 different income tax exemptions, exclusions, deductions, credits, deferrals, etc. As concerns the federal excise tax system, 9 different types of excise taxes produced 244 tax expenditure provisions.^[12] According to some estimates, tax expenditures now total somewhere between \$700 billion and \$800 billion a year.^[13]

Moreover, since tax expenditures function like budgetary entitlements, they can grow even without advocacy.^[5] For this reason, they are hard to eliminate. Once enacted, tax expenditures virtually never get removed from the tax code. Out of more than 100 tax expenditures enacted in the period between 1913 and the passage of the 1986 Tax Reform Act, only 13 had been permanently eliminated. Some say that the design of tax expenditure policies, with their

built-in growth, holds the key to the "indestructibility" of these provisions. It essentially commits policy makers to enforce decisions made long ago, while denying them the ability to reallocate resources toward the newly emerged needs.^[1]

Also, under tax expenditures' tendency to survive and expand lie strong economic and political motivations. As tax expenditures reduce the amount of taxes, they also force overall statutory tax rates to rise in order to obtain the same amount of revenue. It sets out a chain reaction: Higher rates prompt interest groups to increase their efforts in obtaining new, or increasing existing, tax benefits. Because stakes are high, these groups are strongly motivated to organize support of a given provision in such a way as to make it difficult to later eliminate or change it. In contrast, taxpayers in general, who would benefit from smaller tax rates, are too diffuse and disorganized to perceive any advantages from the elimination of the tax expenditure provision. Thus, the lobby for the tax expenditure is much stronger than the opposition to it.^[1]

Tax expenditures diminish the tax base, have a negative effect on revenue capacity, and decrease the resources available for funding other programs or reducing federal deficit. Interestingly, the largest revenue losses have been caused by those tax expenditures that either accompanied the enactment of the income tax or were introduced soon after. Almost 85% of 1993 tax expenditure revenue losses were attributed to the tax expenditures listed before 1950, and among them, almost 50% were caused by the tax expenditures enacted before 1920. In contrast, only 6% of the 1993 revenue losses stemmed from the tax expenditures originated since 1970.^[1]

Tax expenditures increase administrative complexity of the tax code. Witte explains, "Fine-tuning to achieve refined economic or political effects often adds amendment on amendment to provisions such as capital gain, the expensing and depletion of mineral resources, the minimum tax, and a range of real estate and agricultural provisions designed to contain tax shelters. The result is often that, within the scope of a single provision, small policy empires are created that may be thoroughly understood by only small groups of government and private-sector experts."^[4] Major side effects of this complexity are decreased compliance with the tax code and the inefficient use of private as well as government resources.

Contrary to their counterpart, direct expenditures, tax expenditures are not designed to affect income redistribution. Their role is to subsidize population in order to create various economic incentives and to encourage certain investment and consumption activities. However, while providing some benefits for nearly every income class or occupational grouping (see [Table 2](#)), tax expenditures disproportionately benefit

the well-off, as well as private corporations. For instance, the top 10% of earners receive 24% of employer-sponsored health insurance benefits. When applied to families with different annual income, this means that those earning \$100,000–\$200,000 receive from the government \$1,700 for health insurance a year, while those earning \$10,000–\$20,000 get only \$150.^[13] This effect is known as “upside-down” subsidy.^[1]

Witte, in this regard, argues that we cannot apply to tax expenditures the standard of an equal division among people, usually used in discussions of equality of income and wealth, because the assumption that tax expenditures should be equally distributed among the filers of tax returns is unrealistic and misrepresents the political intent of these provisions. Tax expenditures are distributed in direct proportion to the amount of taxes paid. They tend to provide relatively greater benefits to higher income taxpayers because the latter pay higher taxes.^[4]

At the same time, Howard, in his innovative research, provides a new outlook on tax expenditures as indirect tools of social policy. According to Howard, tax expenditures have had a significant impact on the development of the American welfare state, of which they are an integral although less visible part—“a hidden welfare state,” as he^[5] puts it.

As tools of social policy, tax expenditures possess certain qualities that give them a considerable tactical advantage over direct spending. These qualities are low visibility of tax expenditure costs, less stringent budgetary reviews, ease of enactment (can be appended to a bill), and their defensibility on multiple grounds.

CONCLUSION

The concept of tax expenditures is not universally accepted. But, like it or not, with the demise of “the era of big government” their role as policy tools will only increase. They’ve already become the “vehicle of choice” in distributing government funds.^[2] And in many respects, tax expenditures are the efficient, effective, and equitable way to provide government assistance to citizens. At the same time, the flaws inherent in them call for increased scrutiny over them. To address this need, several new frameworks have emerged, such as to bring tax expenditures within the scope of the budgetary process,^[14] to incorporate tax expenditures into the performance review process,^[15] and to evaluate them under the same constitutional criteria as direct spending programs.^[16] The ultimate goal of these and many other efforts is to increase the usefulness and visibility of tax expenditures and force the comparisons between conventional and non-conventional spending.

INTRODUCTION

Who really pays the taxes? Many people worry about having to pay more than their “fair share” of taxes. It is important to understand where the true economic burdens of a tax lie, for purposes of ensuring whatever concept of fairness has been agreed upon and for understanding the effect of the tax on efficiency (its influence on economic decisions). Of course, because equity is often in the eye of the beholder, there are many different views of fairness.

The economic effect of a tax is often not as clear as it initially appears to the observer. This is because the actual burden of a tax can be shifted from the party who is legally required to pay the tax. The tax burden may show up in higher prices to buyers. If it is difficult to pass the tax on to buyers, it may be possible for a company to shift the burden to workers. While it is unusual for workers to see an actual decrease in nominal wages or salaries, they may fail to receive wage adjustments that fully cover inflation, or they may be expected to pay a higher share of medical benefits. Both of these are also ways to shift the tax burden from the producer to the workers. Depending on how much of the tax can be shifted to workers or consumers, the owners of capital may have to bear all or part of the burden in lower profits.

In other words, the economic incidence of the tax may differ greatly from the statutory incidence. This is often not understood by proponents or opponents of a tax, but it is important for a policy maker to consider when weighing the options of potential tax reform or new taxes. It may be worthwhile to try to educate the citizenry about some of the simple incidence issues. This is much easier if the policy makers understand incidence issues.

Tax incidence studies analyze the shifting of taxes from one party to another. The focus may be on whether the tax is disproportionately borne by people in one region or one industry. Opponents of tobacco taxes often raise issues of regional incidence, because only a few states are major suppliers of tobacco. More often, incidence analysis focuses on how people of different income levels are affected by taxes. The economic burden will fall on those who actually pay the tax through higher prices, lower profits, or lower wages.

Often, this burden is shared between two or three groups, as only partial shifting occurs.

An incidence analysis may or may not take into account the effects of other taxes and of government expenditures. The full incidence of a tax depends not only on how the money is raised, but also on how it is spent. If revenues raised by tax are targeted or legally restricted to a particular use, the analysis should ask how the benefits of the expenditures are distributed across the population.

Often, tax revenues are not targeted to any particular use. In that case, the simplest kind of incidence analysis is appropriate. It is based on the assumption that other taxes as well as the makeup of government expenditures stay the same. Therefore, the only necessary effects to consider are those of the new tax. Alternatively, a tax incidence study could examine the effects of substituting one tax for another, with the level and composition of government spending staying the same. If property taxes are reduced, while sales taxes are raised to make up the lost revenue, this would be an appropriate question to study. The most complex variant of incidence analysis examines the spending effects as well as the taxing effects on various population groups.

TAX INCIDENCE IN COMPETITIVE MARKETS

It is commonplace to allege that profit-maximizing businesses will pass the tax on to customers.^a However, in competitive markets, where there are so many businesses that no one business can set the price on their own, this is unlikely to be the case, at least in the short run. Raising prices by the full amount of a new tax would reduce sales and hurt profitability. In Fig. 1, a tax of \$1 per item is levied on the seller, causing the supply curve to shift to the left. While producers were willing to sell 400 units at a price of a \$1.50 each, they now have higher “costs” due to the \$1 tax. Ideally,

^aRecall that firms in a competitive market produce the quantity at which marginal revenue (or price) equals marginal cost. An excise or sales tax raises the marginal cost of production, leading the market determined price to rise also.

Fig. 1 Half of new tax borne by buyers.

producers would like to continue to sell 400 units and charge \$2.50 per unit, recouping the entire burden of the new tax. Buyers, however, will not purchase 400 units if they have to pay \$2.50. In fact, the only way to get them to buy 300 units is to share the cost of the tax with them, charging a market price of \$2.

The share of the tax actually passed on to buyers is determined by the price elasticity of consumers' demand for the good or service (their responsiveness to a price change) and the price elasticity of supply of the sellers. In Fig. 1, half of the new tax will be paid by buyers in higher prices and half will be borne by sellers. The new equilibrium price (after tax) is \$1.50 per unit. Total sales have fallen from 400 units to 300, but not as sharply as they would have if the sellers had insisted on imposing the entire tax on buyers. The desire of sellers to maximize profits leads them to accept part of the tax burden rather than see sales plummet. This principle holds true whether the tax is levied as a percentage of sales price (an *ad valorem* tax) or per unit sold, as in the tax on gallons of gasoline or packs of cigarettes.

In Fig. 2, a much larger share of the upward shift in supply due to new or increased taxes is reflected in the price paid by consumers than was in Fig. 1. A \$1 tax results in a price increase of .90, with only .10 of the dollar being borne by sellers. The short-term market for gasoline would fit this model well. Gasoline purchases are known to be quite unresponsive to price changes (in economic terms, inelastic) in the short run. This is because it takes time to change the fuel efficiency mix of vehicles on the road and to alter established driving patterns between home and place of work. Even at a higher price, gasoline expenditures are a small part of the budget relative to automobile and home prices. Therefore, a large portion of a gasoline tax will be passed on to consumers, because it will impact the quantities they buy slightly. The supply of gasoline is more responsive to price changes (elastic)

Fig. 2 Ninety percent of new tax borne by buyers.

than is the demand for gasoline, making it possible to shift a large part of the tax burden forward to consumers.

Over time, consumers find ways to economize on more expensive gasoline. They purchase vehicles with better mileage performance and alter their living patterns or place of work so as to reduce the need for gasoline. As a result, sellers of gasoline will find themselves bearing more of the cost of a tax as time goes by and the elasticity of demand increases. The long-run demand for gasoline is more elastic in Fig. 3 than was the short-run demand in Fig. 2. Although the supply of crude oil is fixed in the long run, higher prices can encourage more exploration or make high-cost drilling situations profitable, causing some increase in supply, as in Fig. 3. Consumers do not bear as high a share of cost as they did in Fig. 2.

TAX INCIDENCE IN MARKETS WHERE THERE IS SOME MONOPOLY POWER

The way in which tax burdens are shifted away from the party with statutory responsibility is less clear

Fig. 3 Supply and demand for gasoline before and after tax.

when sellers of goods or services have a substantial degree of monopoly power. A new tax raises unit costs of production for these firms also. But although these sellers are able to maintain a price greater than their marginal (or incremental) cost of production, they may find it impossible to pass on the full amount of a new tax to buyers. Because sellers can make a profit, even in the long run, they also have some ability to forego profit.

The relative responsiveness to price changes of demand and supply also matter for these businesses. As in a competitive market, if buyers are highly responsive to price changes, they will cut back their purchases when faced with the prospect of paying the entire tax. In response, the business owner with some price setting power is likely to choose to increase price little and to accept a lower level of profit. In other cases, where consumer demand is inelastic (does not respond much to price changes), the price charged could actually increase by *more* than the amount of the tax. The Rosen and Stiglitz works (referenced below) contain examples of these cases.

WHO REALLY PAYS THE TAXES?

If we consider the total amount of taxes (federal, state, and local) paid by all sectors of the economy, the tax burden is 30 to 33% of income for individuals in all but the very highest and very lowest income groups. The tax system as a whole is roughly proportional, meaning that people of low, middle, and high incomes pay approximately the same percentage of their income in taxes. This result is a product of the combined progressivity of income and estate taxes, where higher-income individuals generally pay a higher percentage of income in taxes, and the regressivity of sales and excise taxes which bear more heavily on lower-income individuals.

Some taxes, such as the social security payroll tax and the property tax, are largely proportional with elements of progressivity or regressivity in them. The corporate income tax, discussed further below, is like all business taxes, in that it must be paid by some human entity. It may be paid by corporate shareholders through lower profits, by workers through lower wages or benefits, by suppliers of other inputs through lower prices, or by consumers of the final product through higher prices. Once the incidence of all of these taxes is taken together, the result is a remarkably similar tax burden in terms of percentage of income across income groups. Our overall tax system in the modern-day United States has little income redistribution built into it. However, increasing or decreasing any one tax can have a differential effect on different income groups.

The Individual Income Tax

State governments rely more heavily on the income tax today than in earlier times. Sometimes, there is a progressive structure of rates, rising as income rises. Others apply one flat rate to all taxable income. When examining the incidence on different income groups, it is important to look at effective tax rates rather than statutory rates. If the calculation of taxable income to the state is based on current federal standards for calculating income taxes, an income tax with a single rate for all payers still has a mild degree of progressivity. This is because a smaller fraction of gross income is collected at lower income levels than at higher income levels. On the other hand, if adjustments and deductions allowable from gross income favor high-income individuals, statutory rates which appear progressive might be closer to a proportional system.

The Corporate Income Tax

As mentioned above, taxes on business are often shifted away from the owners of the business to workers, suppliers, or consumers. The increasing globalization of capital markets means that the rate of return to capital is established in highly competitive world markets. Because financial capital flows easily from one region, or country, to another, its supply to any one state, locality, or even nation is highly elastic. This makes it difficult to shift a tax to the owners of capital in the form of lower profits. As a result, the tax is likely to be borne by consumers, workers, or in some cases, suppliers of inputs. More of the tax will be shifted to those who are unresponsive to price or wage changes in their demand or in the supply they offer to the corporation. This pattern of tax shifting is likely to change with the passage of time, as the ability of the various parties to change purchasing patterns or other behavior increases. Once again, those who are most flexible are likely to be able to avoid the tax.

Payroll Taxes

The social security, or payroll, tax falls equally on employer and employee from a statutory perspective. Employers match the contribution of their employees to the social security system. However, in this case, the supply of labor is less elastic than the demand for labor.^b As a result, most of the employer tax is shifted

^bMales 25–55 show almost no responsiveness in their labor force participation to changes in overall wage levels. Single females have a similarly low wage elasticity. It is only the increasing participation of married women that brings much elasticity to the supply of labor.

backward to workers in the form of lower real wages. Given the elasticity of demand for the particular product or service, some of the tax may also be shifted to buyers in the form of higher prices. This is an excellent example of how the statutory division of the tax between employer and employee has little effect on who bears the actual tax burden.

Rapid increases in the social security tax rate in the 1970s and early 1980s are one culprit when we seek to explain why low-wage workers received pay increases less than the rate of inflation during this period. The additional payroll taxes that employers paid for each hour of work absorbed the productivity gains that would normally be used for increases in worker pay.

Sales or Excise Taxes

In assessing the incidence of an excise or sales tax, there are four key questions to ask:

1. Are the sellers of the affected products responsive to price changes in terms of the quantity they offer on the market? Are they easily able to shift into other lines of production or service which will not be taxed? Fig. 1 shows a greater elasticity of supply than does Fig. 4, in which the supply of land is completely fixed and, therefore, unresponsive to price changes.
2. Are the buyers of the products responsive to price changes in terms of the quantity they will buy? Is this answer different for some buyers than for others?
 - a. Are they able to easily substitute other goods or services that will not be taxed and thus resist the seller's attempt to pass on the tax? The demand curve for gasoline

in Fig. 2 shows far less responsiveness to price than the demand curve in Fig. 1. As a result, more of the tax is shifted to the buyers in Fig. 2 than in Fig. 1.

- b. Is the item a substantial one in their budget or a fairly small part of their total expenditures, even with the tax? The more important the item in their budget, the more responsive buyers will be to a price change, making it harder to shift the tax to them.
3. How will each of the above answers change over time? How much time will it take for the effects to be noticeably different? Generally, the elasticities on the demand and supply sides will be greater as time passes than they are in the near term (Fig. 3 versus Fig. 2).
4. Is the market a reasonably competitive one in which many buyers and sellers jointly determine price, with no large buyer or seller exerting market power? Or, is it a less than competitive market, where one entity, or a group acting in collaboration, dominate pricing and production strategy?

Property Taxes: Unimproved Land Versus Taxes on Improvements and Structures

Property taxes are levied by local governments on the owners of property, regardless of whether another individual or business rents the property for its use. The component of property value due to raw land and its location will pay most of the tax burden in the long run, because it is immobile and cannot move to another location to avoid taxes, as in Fig. 4. There is a fixed amount of land in supply in any one region or country that will not be affected by the level of taxes associated with that land. As a result, a tax on unimproved land, in contrast to taxes on improvements or structures, cannot be shifted to other parties. This result led the eighteenth century economist Henry George to call for a "single tax" on land. Pittsburgh is the only U.S. city that taxes unimproved land more heavily than property improvements, with some interesting results.^[1]

On the other hand, property improvements can be moved from one area to another and can more easily resist efforts to shift a tax to them. Taxes on business personal property are often a source of concern in local economic development efforts, because they discourage investment in plant and equipment, which is generally highly mobile given a long enough time horizon. Only if a locality has some specific advantages of location, natural resources, or cultural amenities will it be able to charge these taxes without losing business investment over the long term. It is the net incidence of

Fig. 4 Supply and demand for land before and after tax.

taxes as well as of beneficial public expenditures that influence the firm or individual.

LOCAL TAXES: WHAT INCIDENCE ISSUES ARE MOST IMPORTANT?

It is important to consider the sources of tax revenue and the uses to which those expenditures are directed when evaluating the incidence of taxes. On the sources side of the ledger, the increasing mobility of skilled labor and of capital in the modern economy mean that the major impact of local taxes is borne in the long run by the owners of land, along with unskilled labor. Skilled labor and capital can migrate to other areas with lower taxes, as long as those areas provide enough in public services and amenities to meet their needs. Land is obviously immobile. Unskilled labor has much lower mobility than skilled labor, because the costs of relocation must be borne upfront and may outweigh the benefits.

Debt-financing, as well as taxes, lowers the value of land or property through a process called capitalization. Potential future owners factor in the additional cost of tax payments to the price they are willing to pay for land. On the other side of the ledger, local expenditures on education, roads, park, and police and fire protection raise the value of property, because buyers will pay more for property associated with these amenities. In the end, the net effect of taxes or debt-financing on property values depends on the efficiency with which government provides services and the values and preferences of current and future residents. This is an important point to remember when proponents or opponents are arguing only the negative effects of taxes or only the positive effects of expenditures.

Arguments for and against various local taxes often ignore the effects of tax shifting and the evidence regarding likely incidence. For example, areas with high tourism favor sales taxes as a way of getting tourists to pay local costs. But if tourists are highly mobile, able to choose between various destinations offering sun and sand (or shopping and culture), sales or lodging taxes may simply depress the prices charged for housing, food, and other amenities. The tax would then be shifted to owners of establishments catering to tourists, and possibly to their workers in the form of lower wages.

On the other hand, if an area has a unique attraction that tourists want to see (the Grand Canyon or the Statue of Liberty), spending is influenced less by price comparisons. More of the tax burden can be shifted to tourists and away from the proprietors of restaurants, lodging, and tourist attractions. Applying the principle that taxing items that are large in the

budget causes more consumer response than taxing items that are small portions of the budget, for example, exempting ski tickets from the sales tax may have little effect on the economics of tourism.^c The ski lift ticket is a relatively small part of the total expenditure for tourists who must spend on airfare and lodging.

TAX INCIDENCE: A SUMMARY

As policy makers and managers consider the role of different forms of taxation, it is important to remember the following.

1. The economic burden of a tax does not necessarily lie with the person legally responsible for paying the tax. As a result, debates about business paying its fair share have more political than economic appeal.
2. Taxes on goods or services are often shifted forward to consumers or backward to workers and suppliers. The way in which the tax is divided depends on the relative responsiveness to price change (elasticities) of the parties involved.
3. If the demand for a good or service is fairly elastic (responsive to price changes) and the supply is relatively inelastic, suppliers will bear more of the tax. Conversely, if the demand is fairly inelastic and supply is more elastic, consumers will bear more of the tax. Where the elasticities of demand and supply are equal, as in Fig. 1, the tax is equally shared.
4. Over a long period of time, individuals and businesses are likely to be able to adjust their behavior much more than is possible during a short time period. This ability to adjust makes them more responsive to the additional costs of a tax and makes it more difficult to shift the tax to them. The relative elasticities of demand and supply may change over time, and with them, the pattern of tax incidence (see Fig. 3 versus Fig. 2).
5. The immediate effect of changes in the expected future stream of taxes, debt, or expenditures on the price of land is called capitalization.
6. An increase in taxes or bonded indebtedness has the immediate effect of lowering the value of land, even though the tax or bond payments will be made over time.
7. If expenditures associated with the tax or debt are viewed as desirable, land values may remain stable, or even rise, rather than fall due to the tax.

^cDespite this, states like Colorado who are dependent on the ski industry often exempt lift tickets.

Team Building

R. Wayne Boss

Leeds School of Business, University of Colorado at Boulder, Boulder, Colorado, U.S.A.

Mark L. McConkie

Graduate School of Public Affairs, University of Colorado at Colorado Springs, Colorado Springs, Colorado, U.S.A.

INTRODUCTION

According to Katzenbach and Smith, “A team is a small number of people with complementary skills who are committed to a common purpose, performance goals, and approach for which they hold themselves mutually accountable.”^[1] While some of these characteristics are obvious, others need more explanation.

Small number of people: Although 50 or more people can theoretically constitute a team, a group of this size breaks into subgroups to do their work. For all practical purposes, most teams range from 2 to 25, and the majority are less than 10.^[1]

Complimentary skills: Effective teams develop the right mix of skills, which include technical or functional expertise, problem-solving and decision-making skills, and interpersonal skills (i.e., those that relate to such things as effective communication, conflict management, listening, and supportiveness).^[1]

Committed to a common purpose: The best teams have a clearly defined common purpose that is clearly understood and that motivates members. In short, it provides a fundamental reason for the team’s existence as a group.^[1]

Specific performance goals: Since specific performance goals are an integral part of the purpose, effective teams consciously take steps to define their team product, create opportunities for clear communications and constructive conflict, identify specific objectives that are attainable and measurable, share power and influence with one another, allow members to experience small wins, and challenge team members.^[1]

Common approach: Teams members need to define how they will work together to accomplish their purpose. Specifically, they need to define who will do what jobs, how they will schedule their work, how decisions will be made, what skills they will need, and how that will happen. They also need to pay attention to the social, economic, and administrative aspects of their work.

Mutual accountability: No group ever becomes a team until it can hold itself accountable as a team; and accountability is impossible without commitment and trust. Accountability is central to team effectiveness.

This includes more than merely having the team leader hold members accountable; it means that people are willing to hold one another accountable to keep the promises they make to themselves, which builds both commitment and trust—two essential elements to any effective team.^[1]

WHAT IS TEAM BUILDING?

Team building activities are interventions designed to build groups of people into teams that have the above characteristics. Although specific designs of team-building interventions vary widely, according to Golembiewski, they typically have the following characteristics:

1. involve as participants individuals who are hierarchically and/or functionally involved in some common flow of work.
2. deal with organizational entities whose members have real and unresolved issues with one another.
3. involve the mutual development of images as a basis for attempting to highlight unresolved issues.
4. involve the sharing of those images or perceptions as a first step toward mutually working through any relational problems.
5. assume that significant organizational problems often are caused by blockages in communication. Confrontations “free up” people to “level” in communicating and thus set the stage for authentic interaction and effective problem solving. Some objective dilemmas such as a critical lack of money cannot be resolved by confrontation designs. In such cases, the ideal outcomes are greater clarity in communicating about the dilemmas and greater willingness to collaborate in doing as much as conditions permit.
6. are short-cycle affairs (lasting one or two days), compared to a typical stranger experience in sensitivity training, which lasts two weeks.
7. are often seen as a springboard for organizational action.^[2]

Successful team-building designs typically result in greater skill development, increased commitment to a common purpose, development of specific performance goals, increased collaboration and agreement on a common approach, and higher levels of mutual accountability. Additional results include more effective communication, a better understanding of one's colleagues and the nature of the problems that affect them, an action plan for dealing with those problems, and a higher level of confidence and interpersonal trust among the participants.

THE DIFFERENCES BETWEEN TEAM BUILDING AND TEAM DEVELOPMENT

Historically, team-building interventions have been conducted almost exclusively by an outside person who is a professional consultant in the field of human resource development or organization development. An outside person could mean either someone from outside the organization or an internal person who is employed by the organization but is outside the work group planning the team building activity. Dyer argues that, "The use of a consultant is generally advisable if a manager is aware of problems, feels he or she may be one of the problems facing the work unit, and is not sure exactly what to do or how to do it, but feels strongly that some positive action is necessary to pull the work group together for more effective operation."^[3]

Team building activities can be intense, in terms of the feelings generated, depending on the degree to which participants confront problems and address issues, particularly those that are interpersonal in nature. These interventions require an extensive knowledge of group dynamics and a high level of skill in facilitating group processes and in dealing with conflict.

Team development interventions have the same objectives as team-building designs, in terms of enhancing problem-solving abilities by dealing with issues that stand in the way of increased effectiveness. However, "The team development facilitator is not a professional, but the team's own formal leader or a designated member of the team. The activities that can be conducted by a team leader or member, who is generally not...[a] professional, are, of necessity, different from those designed to be facilitated by a professional: they are less intense, produce less affect, and demand less of the person who is facilitating and the team members as participants. After a team's members have been introduced to team building by [an outside consultant], that professional can suggest that they follow up with team-development activities to enhance their ability to resolve their own issues."^[4]

THE PHASES OF TEAM BUILDING

The four phases of a team-building intervention include: data gathering, diagnosis, implementation, and follow-up.

Data Gathering

Prior to the team-building meeting, the consultant interviews the participants to identify issues standing in the way of effective teamwork and goals for the meeting. Typical questions include those that help the participants identify group strengths, challenges and problems, leader effectiveness, interpersonal issues, and things people would like to accomplish. Participants can also complete questionnaires designed to measure various aspects of effective teamwork. Additional data can also be gathered by direct observation of group behavior in meetings.

Diagnosis

The consultant thoroughly examines the information from the interviews, questionnaires, and observations, and identifies problems that prevent team members from working together effectively. The importance of this diagnostic phase cannot be overstated. Indeed, the success of the team-building intervention depends on its accuracy. Consultants should always do a diagnosis before prescribing treatment.

Once the diagnosis is completed, the consultant identifies the intervention that will help participants resolve the problems and achieve the goals of the meeting. The general diagnosis and recommended design are then shared with the team leader and members to ensure ownership of the diagnosis and commitment to the meeting. The consultant must exercise caution to avoid opening up problems that cannot be immediately resolved. This is particularly important if the team-building meeting is scheduled more than 24 hours after this feedback meeting.

Implementation of the Team-Building Design

Participants meet together in a room that is comfortable, private, and free from interruptions. The consultant shares the detailed diagnosis and then helps the group build an agenda of what they want to talk about and goals for the meeting. The agenda items are then prioritized, and the group goes to work on the agenda. The consultant's responsibilities include group facilitation, clarifying issues, providing theory input, and documenting decisions made during the meeting, including what will be done, who will do it, when it will

be done, and how it will be evaluated. Mechanisms should also be put in place for how team members will evaluate the group's effectiveness once they get back home.

Follow-Up

Follow-up activities ensure that the team-building action gets implemented back home. This can take place during group meetings and/or individual meetings between the participants and the leader to determine the extent to which they have kept their team-building commitments and to identify new issues that impact the group.

A TYPICAL TEAM-BUILDING DESIGN

A widely used team building intervention^a called a "perception sharing" or "Three-Dimensional Image" (3-D Image) design,^[6] is intended to deal with the dysfunctional aspects of conflict as they affect the perceptions that members of a group have of one another. The group members share perceptions and then confront and resolve whatever problems they indicate. Each 3-D Image confrontation team-building session is conducted off-site and lasts three days.

The participants from each team are divided into two groups: top management personnel and subordinates. The subordinates were asked to respond independently to three questions:

1. How do we see ourselves as members of this work group?
2. How do we think [the leaders] see us as members of this work group?
3. How do we see [the leaders] as members of this work group?

The leaders respond to three similar questions:

1. How do we see ourselves as members of this work group?
2. How do we think they [e.g., our subordinates] see us as members of this work group?
3. How do we see them [our subordinates] as members of this work group?

Both groups respond to their questions in separate rooms, without the aid of the consultants. When the number of subordinates is relatively large (eight or more people), the subordinates are divided into smaller groups of four or five people each.

All participants are asked to write their responses to each question on separate sheets of newsprint.

They are asked to be as explicit as possible, using adjectives and short phrases, and to keep in mind specific examples they might later use to illustrate each descriptive phrase. They are further instructed that consensus is not required for the phrase or descriptive statement to be posted. Rather, if different people have diametrically opposite perceptions, both perceptions are to be posted, since the purpose of the exercise is to share as much accurate information as possible.

Once the responses to each question have been written on the newsprint, the various sheets are taped to the wall, side by side, and silently reviewed by all participants. After everyone has read all the responses, one person from each group reviews the group's responses to the various questions and gives examples of specific behaviors that might have contributed to those perceptions.

The basic ground rule for this portion of the session is that questions are to be directed toward clarifying and/or illustrating specific perceptions. At this stage, agreement is neither expected nor necessary. It is important, however, that the participants understand what is meant by each descriptive phrase and why group members perceive the situation the way they do. Those items about which there is disagreement or which seem to be problems are systematically flagged for later discussion. The review of the various responses posted on the newsprint typically generates a great deal of energy, and much interest is manifested in both the perceptions posted and the examples of specific behavior that precipitated those perceptions.

The 3-D Image procedure helps to clarify perceptions, generate valid information, and identify current problems. Specifically, the approach is effective for a number of reasons:

1. Basically, participants need such information, disconcerting or even initially hurtful though it may be.
2. Participants usually understand that the best—indeed, perhaps the only—way to raise the probability of receiving such needed information in the future is to be accepting of the 3-D Images in the present. It should be noted that acceptance does not necessarily mean agreement. "I can understand how you see it that way," such a case of acceptance without agreement might go, "but I hope you recognize there are many things about which reasonable people can and do differ."
3. Confrontation with the 3-D Image procedure is a shared experience that can build mutual identification and understanding, which is what many participants are seeking. The design is accepted and valued, consequently, and, in a sense, made to work.

^aMuch of this discussion in this section is adapted from Ref.^[5].

4. Most individuals are uncomfortable if their verbal or non-verbal behavior is at some substantial variance with what they really know, believe, or feel. That lack of comfort increases sharply if the persons suspect that relevant others are being similarly incongruent. The analysis of 3-D Images usually helps to reduce such variance by encouraging a mutual escalation toward openness and owning.
5. Substantial agreement typically exists between pairs of 3-D Images.... This statement almost always increases the participants' sense of mutual competence and acceptance by confirming that one person or group shares perceptions with another, as well as by signaling that a real process of exchange has been begun.^[7]

Once the responses on the newsprint have been sufficiently explained, the flagged items are then addressed, beginning with the issues the subordinates have with the leaders, then moving to those that the leaders have with the subordinates.

Central to the success of the design is the contracting stage in which participants negotiate decisions on issues associated with the various perceptions. As an essential element of the design, the consultant documents the solutions and individual commitments made during this stage. These solutions and individual commitments (often numbering six to ten pages of single-spaced typewritten material) are reviewed periodically throughout the meeting to ensure that what is recorded is exactly what the participants intend. The list then constitutes an action agenda and is made available to all participants and used as a basis for follow-up at a specified time.

Additional activities during the three-day meeting can include the completion of questionnaires relating to interpersonal communication and participants' needs in the work environment. In addition, the consultants give short lectures that provide a theoretical perspective on the processes taking place at a given moment and the difficulties team members are experiencing with those processes.

THE PROBLEM OF REGRESSION

A real limit exists on what can be accomplished in a short team-building session.^[8] Without systematic follow-up, the positive results achieved by the team-building design may be negated. Indeed, a basic problem with off-site team-building sessions is the regression or fade-out that often occurs after the participants return to the home organization.^[9] Typically, the high level of interpersonal trust and cooperation may last for several weeks, at best. The organization's

climate then begins to deteriorate toward its previous conditions, requiring an additional off-site session to work through problems and resolve interpersonal issues that either remain unresolved or have arisen since the last meeting. A number of interrelated variables contribute to this tendency toward regression, including unfulfilled expectations, low tolerance for error, lack of process skills among members, lack of accountability, consultant dependency, turnover among key staff members, changes in policies and procedures, a lack of cultural preparedness back home, a lack of political support, a lack of a clear reward system to reinforce new behaviors, and a lack of consultant availability.

HOW TO PREVENT REGRESSION

In order to prevent regression, a team-building session must be seen as part of a larger and ongoing change effort. Research has shown that one-shot team-building efforts do not produce the desired long-range results and that few, if any, changes take place without effective follow-up.^[3]

One way to prevent regression following team-building meetings is for the leader to begin holding a regular personal management interview (PMI) with his or her direct reports. A PMI is a regular, private meeting between the leader and each of the people who report to him or her. Detailed notes are kept on all action items, and both people receive a copy of the notes at the conclusion of the meeting. The first few minutes of each meeting are spent in follow-up of the action items of the last meeting.

The purpose of the PMI is to meet the needs of the individual team members. Hence, appropriate areas for discussion include administrative and organizational problems, training in administrative and management skills, interpersonal problems that may exist between the two participants, information sharing to bring people up-to-date, individual and organizational needs, successes and achievements, and personal problems. The last few minutes are spent in a review of the action items generated during that meeting.

Even though the PMI appears to be a very simple intervention, it has a powerful impact on both the individual team and the organization. Research indicates that when leaders hold regular PMIs with their direct reports, regression can be prevented for as many as 20 years with no additional interventions.

Telehealth and State Government Policy

Mary Schmeida

*Department of Nursing Research and Innovation, Cleveland Clinic,
Cleveland, Ohio, U.S.A.*

INTRODUCTION

Telehealth represents a new paradigm in health care. Considered both an administrative reform and regulatory policy, it draws on electronic government and electronic commerce. Although no authoritative consensus on the definition of telehealth has been reached, Congress defines it as the use of electronic information and telecommunications technologies to support long-distance clinical health care, patient and professional health-related education, and public health care and administration.

In the era of technology, state policy makers find telehealth important. Advanced communication technology can provide health care services to state residents. To governments, Internet technology can make product and service delivery both cost-efficient and convenient. As a powerful tool for reshaping government, it is expected to help build economic strength, allowing government to be catalytic and enterprising. State policy makers are incrementally passing telehealth-enabling legislation, and a patchwork of laws exists today.

TELEHEALTH EVOLUTION

History documents the beginnings of telehealth throughout the twentieth century. The Nebraska Project of the 1950s, using closed-circuit television, is generally considered the first comprehensive attempt at telehealth, advancing clinical psychiatry and medical instruction^[1] and promoting remote consultation to prisons, courts, and schools. Projects of the 1960s and 1970s involved the U.S. military and the National Space and Aeronautical Administration,^[2] with innovations advancing emergency and cardiology care. Recent evolution is dramatic, combining audiovisual components of traditional forms of media with the interactivity and speed of telephone and e-mail, permitting the exchange of patient information regardless of geographic distance; facilitating interaction between practitioners and consumers; transmitting images via satellite to experts for interpretation; and entering surgery, as seen in experimental robotic coronary artery bypass surgery.

CONDITIONS DRIVING TELEHEALTH POLICY

Several conditions are driving telehealth policy across the states. External conditions driving state telehealth-enabling laws include the lack of access to medical specialists, spiraling costs of health care, and growing consumer sophistication and demand for quality health care. Political conditions driving policy are the bureaucratic issues of a top-down government that no longer works to satisfy citizen demands for quality goods and services. A flexible and agile government can respond to the changing external environment, with quick information technologies to meet citizen demands, breaking down bureaus and reshaping government.

Lack of Access to Medical Specialists

Rural states have a great lack of access to specialists. Across the states, rural regions are facing a growing maldistribution of medical specialists, hospitals, and health care resources. Specialists and advanced diagnostics have been more readily accessible in urbanized areas versus remote rural settings. For example, West Virginia is among the most rural, poorest, and most elderly of the states, and has a lower-than-national-average supply of physicians.^[3]

The original goal was to improve consumer access to health care. Inequitable distribution of medical resources, in relation to the distribution of need in inaccessible state populations, has led to the expansion of the national information infrastructure, making telehealth a feasible solution to minimize disparities. Rural consumers can now seek video teleconsultation at access points or facilities equipped for telecommunications in remote areas. For example, pediatric populations in rural regions can receive early disease intervention that has been previously delayed due to distance and cost. Although the lack of specialty services in rural regions has driven the telehealth idea in the past, professional shortage areas can also include urban regions of a state because metropolitan isolates can also have difficulty accessing services.

Spiraling Costs of Health Care

Spiraling health care costs is a condition underlying telehealth activity. The urban consumer price index shows a rising yearly trend for the cost of health care from 74.9% for 1980, to 162.8% for 1990, to 272.8% for 2001.^[4] The growing elderly population demanding costly services is also driving policy. The projected rise in Medicare spending is a function of the aging population's longevity requiring expensive specialized services, the retirement of baby boomers along with the declining ratios of workers to Medicare beneficiaries, and the overall increased costs of health care such as the increased cost of diagnostic equipment.^[5] Telehealth as a cost containment strategy for entitlement programs can reduce: opportunity costs, costs associated with overtreatment and medical error, out-of-pocket expenses, and costs for insurance companies. State prison systems using telehealth are not only avoiding costs of security guards and transportation, but increasing public safety.

States are seeking creative financial arrangements. Because initial capital costs can be substantial and there are incremental costs with each use, cooperative initiatives between public, private, and non-profit sectors can limit start-up and program sustainment costs. For example, Nebraska created a health care trust fund awarding grants for infrastructure development. Creative arrangements have led to consortiums of neighboring states implementing projects. Regional networking can minimize program costs while sustaining projects, inviting interstate commerce, and bringing new telehealth policy ideas to the table.

Growing Demand for Quality Health Care

Telehealth is expected to improve the quality of U.S. health care. Research links poor U.S. health care to underuse, overuse, and misuse of services. With choice as a proxy for quality, government telehealth websites inform residents on options in choosing a health plan and premium, practitioner(s), and hospital setting for services.^[6]

Many states are improving the quality of care their residents receive by implementing innovative telehealth ideas, with Texas, Hawaii, North Carolina, California, Virginia, and Michigan as leaders in scope of implementation.^[7] For example, telehealth home care can improve quality by: preventing hospital readmissions; predicting and avoiding chronic illness setbacks; and bringing early medical intervention to remote populations, thus improving clinical outcomes.

STATE TELEHEALTH-ENABLING LAWS

There are barriers to expanding the use of telehealth. These include a lack of: uniform statewide physician

licensure statutes; laws regarding disclosure of restricted patient information to unauthorized individuals; interstate reimbursement to practitioners; and strict Internet regulation for the dispensing of pharmaceuticals on-line. Enabling laws create the legal environment that makes telehealth feasible. Although federal legislation has tried to create this environment, the states are taking the lead and leaving a patchwork of enabling laws. However, both state and federal telehealth legislations still lag behind the rapid and dramatic change in technology.

Several states are leaders in passing telehealth-enabling laws. Georgia, Kansas, Louisiana, South Dakota, and Texas are leaders, whereas West Virginia has been relatively inactive in initiatives to overall state telehealth policy. Texas has been revolutionary—assuming a formal position among the states in coordinating overall planning for telehealth development, promoting the idea with public utilities, and setting reasonable telecommunication costs and prison telehealth.^[8]

Telehealth Medicaid Practitioner Reimbursement Laws

States are enacting Medicaid telehealth practitioner reimbursement laws. This administrative reform policy changes previous policy on unfair fee-splitting arrangements for practitioners and the lack of reimbursement for provision of services to Medicaid recipients. Medicare has been on the forefront on this topic, expanding its reimbursement policy to include a variety of originating telehealth sites, shaping policy for state programs, and as a policy example for the private insurance industry. Some state Blue Cross/Blue Shield plans, among other private insurers, are electing to pay for select telehealth services.

Nineteen states have adopted Medicaid telehealth reimbursement laws. As an innovator, Texas requires that reimbursement not be denied due to lack of in-person consultation and also provides parity between telehealth and in-person health care on deductibles and copayments. All states enacting this law reimburse for medical health needs, whereas California, Kansas, Minnesota, Montana, Texas, and Virginia also reimburse for mental health.^[9]

State Health Care Information Privacy Laws

The use of the Internet for patient care is a growing concern. Over the past decade, consumer privacy attitudes have changed, with 60% of Internet users expressing concern that placing medical records online can be violated even if password-protected, and 89% of those seeking on-line health information expressing concern that the website may sell or give

other institutions information about their activities.^[10] Although technology can benefit practitioners, the tradeoffs can jeopardize the integrity of sensitive health information.

States are responding to consumer privacy demands with legislation. Although the Health Insurance Portability and Accountability Act of 1996^[11] provides new safeguards in this area, states must also respond. To date, health privacy statutes vary significantly across the states regarding electronic means for disclosing private health information and storing the information. Twenty states have restrictions on disclosure of patient health information by hospitals and health care entities. For example, Rhode Island prohibits medical information from being disclosed regardless of the institution holding the medical record. Most states have not intended statutes to be comprehensive, thus lagging behind the needs of innovative health care.^[12]

Interstate Physician Licensure Laws

No uniform state licensure laws exist for governing telehealth practitioners. Updated laws would protect consumers and monitor the telehealth activities of providers regulating the practice of physicians across the states. Recognizing the significance of this issue, 17 states have adopted full telemedicine licensure status for physicians. This allows physicians physically located in their home state or foreign country to perform certain patient care services in another state through the use of telecommunications, or to practice medicine in another state. Colorado allows nothing to prohibit consultation between a Colorado physician and a practicing physician in another state. Nine states allow interstate telehealth by certificate, registration, or special licensure, whereas 24 states have no interstate licensure laws for physicians.^[13] Interstate licensure is important to telehealth diffusion because any uncertainty among practitioners about licensure status and associated liability risks will restrict activity.

Internet Pharmacy Regulations

State Internet pharmacy regulations are critical to ensuring quality health care. Internet pharmacy consumers can face injury if prescriptions are electronically issued by pharmacies without knowledge of the consumer's medical history. As an initiative to regulate Internet pharmaceutical activity, President Clinton, in 1999, expanded Food and Drug Administration (FDA) enforcement powers to eliminate unsafe dispensing of drugs on-line. However, the states have traditionally regulated pharmacists and physicians, and are increasingly stepping up to enforce unsafe pharmaceutical electronic commerce activity. Thirteen states are policy

innovators, enacting legislation requiring physician initial examinations before prescribing medication on the Internet—Alabama, Arizona, California, Florida, Iowa, Idaho, Kansas, Maine, Mississippi, Nebraska, New York, Ohio, and Virginia. Although regulations would restrict the pharmaceutical electronic business growth, restrictions would protect consumers and improve the quality of electronic prescription services.^[14]

ECOLOGICAL FACTORS EXPLAINING ADOPTION OF LAWS

Several ecological factors are influencing the adoption of telehealth-enabling laws. Policy diffusion literature shows political, economic, intrastate, and interstate policy networks, and demand factors can affect whether states adopt legislation across issue areas. Using 50 state data with statistical controls, Schmeida^[15] found that ecological determinants matter in explaining the adoption of the four telehealth-enabling laws discussed above. The presence of designated mental health professional shortage areas is found to influence the adoption of all four laws. State legislative professionalism explains the adoption of all enabling laws, except Internet pharmacy regulations. Greater legislative professionalism increases the likelihood that states will adopt privacy laws, but not necessarily telehealth reimbursement and physician licensure laws.

Particular state ecological factors also explain the adoption of specific telehealth laws. Illustrative of these are the following:

- States with higher information technology administration and management capacity, and populations over the age of 64 years are more likely to adopt Internet pharmacy laws.
- States with greater electronic commerce and business regulations are less likely to adopt physician telehealth licensure laws, but are more likely to adopt full licensure status.
- States with a greater percentage of women in the legislature are more likely to pass privacy laws; this is important because women in politics have historically been instrumental in driving health policy.

Such findings provide policy makers with a foundation for understanding this evolving policy area.

CONCLUSION

As an innovative policy, telehealth is important to the state government. Drawing on electronic government and electronic commerce, it has the potential to improve access to health care services, to contain costs

while improving service quality, and to reshape the government. State policy makers are passing enabling legislation, although legislative details vary from state to state. Likely benefits of telehealth policy are cost containment, improved access for underserved populations, and enhanced quality of care.

Teleology and Utilitarianism

James R. Heichelbech

Graduate School of Public Affairs, University of Colorado at Denver,
Denver, Colorado, U.S.A.

INTRODUCTION

Teleology and utilitarianism describe approaches to ethical thinking that are goal oriented and focused on consequences. Teleology is specifically concerned with purposes or goals, while utilitarianism is the view that an act is ethical to the extent that it satisfies interests or increases happiness. Together, teleology and utilitarianism are contrasted with deontological conceptions of ethics, which are focused on obligations and motives.

TELEOLOGY

Aristotle's Concept of Teleology

From an ethical theorist's standpoint, teleology is a metaphysical concept, especially in the context of Aristotle's ethics. Accordingly, the *Cambridge Dictionary of Philosophy* defines teleology as "the philosophical doctrine that all of nature, or at least intentional agents, are goal-oriented or functionally organized."^[1] For Aristotle, it is a thing's purpose that determines whether it is excellent or virtuous. However, the Aristotelian emphasis on teleology was largely discredited with the emergence of the scientific revolution. Rather than explaining a thing in terms of its purpose, scientists came to believe that things should instead be explained in terms of their formal properties, through principles of nature. Charles Darwin delivered the final blow to teleological science in the nineteenth century, as he argued that nature does not unfold as part of a complex web of purpose, but through natural selection.

The Connection Between Teleology and Utilitarianism

Contemporary philosophers who turn to Aristotle tend to avoid the emphasis on teleology and instead focus more generally on character. Often, the avoidance is an explicit rejection of Aristotle's essentialism, or the view that each thing has an essence. Essentialism is considered problematic in light of its possible implications, such as Aristotle's claim that some people are

natural slaves. The avoidance is also due to lack of theoretical adequacy. However useful it might be in discussions of ethics to say that a person has a purpose, it is not clear that each person's purpose can be determined to the extent necessary for making ethical judgments about that person.

While ethical theorists tend to avoid the teleological element of Aristotle, political philosophers have reintroduced the term in connection with utilitarianism. The basic idea of utilitarianism is that sentient beings have goals and, therefore, have interests that ought to be satisfied. Such interests, then, can be counted as a measure of a being's purpose. Utilitarianism is for this reason considered teleological, not because it is an Aristotelian theory, but because it is concerned with the goals of sentient beings. In other words, the use of the term "teleology" has shifted from the context of character assessment, where goals are an important part of character, to realization of the person's goals.

UTILITARIANISM

Utilitarianism emerged in Great Britain toward the end of the eighteenth century. Consistent with the empiricist tradition prevalent at the time in Great Britain, utilitarians rejected rationalism, arguing that it could not serve as a basis for political or moral justification. Jeremy Bentham and John Stuart Mill argued from common sense that what matters is not the dictates of reason but the capacity for pleasure and pain.

Jeremy Bentham's Utilitarianism

In *The Principles of Morals and Legislation*, Jeremy Bentham (1748–1832) described the utilitarian principle as that according to which we can evaluate actions depending on their tendency to increase or decrease the happiness of those whose interests are in view.^[2] Ethics, therefore, concerns the happiness of individuals and nothing else.

The focus on the capacity for suffering leads to a shift from focus on the moral agent to a focus on the moral "patient" and widens the scope of moral considerability to include all beings with interests, such as non-human animals. Because a capacity for

experiencing pleasure and pain is the criteria for identifying interests, the interests in view are the interests of all who are in a position to experience pleasure or pain as a result of one's actions. But Bentham's utilitarianism is not as altruistic as it sounds. Although he acknowledges that we are sometimes motivated by sympathy, benevolence, love of amity, or love of reputation, the only adequate ethical motives are one's own interests.

With the emphasis on individual interests, Bentham's utilitarianism is useful for political justification and for public policy. The public interest, he argues, is merely the sum of individual interests. Government action, then, is justifiable only to the extent that it tends to increase the happiness of the individuals within the community more than it tends to decrease it. In this respect, public policy becomes inherently normative, as all stakeholder interests carry moral weight.

John Stuart Mill's Utilitarianism

In *Utilitarianism*, John Stuart Mill (1806–1873) presented a more theoretically complete version of utilitarianism.^[3] He followed Bentham in claiming that the only legitimate ethical principle is that of utility—an act is ethically right to the extent that it increases happiness, or pleasure, and wrong to the extent that it decreases happiness or causes pain. However, Mill argues for a much stronger principle, one according to which an act is right to the extent that it produces the most happiness for the most people, not just the happiness of those whose interests are “in view.”

Mill's version of utilitarianism differs from Bentham's in a number of other ways. Whereas Bentham merely described the various kinds of pleasures, Mill distinguished higher pleasures from lower ones. Whereas Bentham used utilitarianism to support modest political ends, such as penal reform, Mill envisioned a much broader horizon of social progress. Finally, whereas Bentham argued that all moral motives can be reduced to self-interest, Mill described sentiments of justice.

The distinction between higher and lower pleasures is driven by Mill's belief that “it is better to be a human being dissatisfied than a pig satisfied” (Ref.^[3], p. 10). His argument is that anyone who has experienced lesser pleasures and more cultivated ones would prefer the latter. “No intelligent human,” he says, “would consent to be a fool” (Ref.^[3], p. 9). It is worth noting that this is essentially an empirical argument, not an assumption about human nature included as a supplement to utilitarianism. If it turns out that most intelligent, educated people regret their heightened sense of appreciation, then Mill would have to abandon the claim that “higher” pleasures are better.

Consistent with his focus on higher pleasures, Mill envisions a much more optimistic, progressive political horizon. Although Mill agrees with Bentham that it is reasonable to expect people to focus on the interests of those in view, it is clear that Mill thinks our focus should be as broad as possible. He even goes so far as to suggest that the evils of the world, such as poverty, can be eliminated through the wisdom of society and good sense of individuals.

However, the most significant difference between Bentham and Mill is found in their accounts of moral motivation. Whereas Bentham concluded that the only motive is self-interest, Mill argued that moral motives include “the internal sanction of duty . . . a feeling in our own mind; a pain, more or less intense, attendant on violation of duty” (Ref.^[3], p. 27). Moral motives are more complex and more altruistic. The sentiment of justice, for example, consists of the belief that someone has been harmed and a desire to punish the harm-doer. Furthermore, Mill argued, it is “by virtue of his superior intelligence . . . [that] a human being is capable of apprehending a community of interest between himself and the human society of which he forms a part, such that any conduct which threatens the security of the society generally is threatening to his own” (Ref.^[3], p. 50). This is significantly beyond the motive of self-interest described by Bentham.

Criticisms of Utilitarianism

There are several difficulties with the principle that one should always act to maximize happiness. First, there is the problem of calculating utility. One must always determine what each person's interests are and what makes that person happy, and then weigh those interests against one another. Some offer the distinction between *act*-utilitarianism, which requires that every action maximize happiness, and *rule*-utilitarianism, according to which one need only act according to a rule the actions conformable to which *tend* to increase happiness. Once it is determined that certain rules tend to maximize happiness, then one need only follow the rule. Even so, critics argue, it is not clear that all interests can be adequately measured, much less compared against one another, such that we could identify the aggregate “maximum” of happiness.

A second difficulty is that some ethical choices justifiable by utilitarianism seem counter-intuitive. Imagine a case in which thousands of people suffer from a condition that is excruciatingly painful, though not life-threatening. Imagine as well that their suffering can only be alleviated by extracting a particular chemical from the brains of a few people, resulting in their deaths. Utilitarianism seems to recommend that we sacrifice the few for the sake of the many.

The calculation seems to suggest that the fewer people sacrificed and the more suffering that will be alleviated, all the more reason to sacrifice the few. But, intuitively, there seems to be something wrong with sacrificing even one person's life to alleviate the suffering of others, regardless of how many there are.

A third problem is that utilitarianism has no way to distinguish legitimate interests from illegitimate interests. Even if the people to be sacrificed in the example above *wanted* to sacrifice their own lives, there is no way to determine whether they *should* want to do this. Utilitarianism tells us that interests should be satisfied, whatever they might be.

Contemporary ethical theorists in the utilitarian tradition tend to favor a slightly less rigid conception of ethics, usually some form of *consequentialism*. Consequentialists agree that interests matter, and so the consequences of our actions matter to the extent that interests are either satisfied or not satisfied. But, consequentialists are not necessarily committed to the view that satisfaction of interests is the *only* thing that matters or that *all* interests matter equally. Whereas Mill was burdened with the task of showing that the unsatisfied human is still happier than the satisfied pig, consequentialists are free to evaluate interests on other grounds, such as basic rights.

TELEOLOGY AND UTILITARIANISM IN PRACTICE

Teleology and utilitarianism have served as inspiration and justification. The teleological/utilitarian perspective in ethics is significant for public administrators for two reasons. First, the growing emphasis on "customer service," as found in closer attention to mission statements and organizational values, explicitly asks administrators to be aware of interests. Second, the teleological/utilitarian approach has been key to justifying a free market economy on a macrolevel and the use of cost-benefit analysis on a microlevel. For this

reason, administrators are better able to interpret fiscal policy goals through a teleological/utilitarian perspective, especially with the accompanying emphasis on measurement and calculation.

Although public administration tends not to be teleological or utilitarian in the broad sense, as its goals are externally determined, legislation is frequently motivated by teleological/utilitarian considerations and therefore might require development of public policy accordingly. Spending limitations, for example, reflect efforts to increase the well being of taxpayers, and we benefit from implementation strategies consistent with the utilitarian spirit of the legislation.

The means by which administrators implement legislation are clearly and directly teleological/utilitarian in character. The values of efficiency and effectiveness, for example, insist on limiting waste and providing the greatest possible value. Put another way, to the extent that administration is inefficient and ineffective, the aggregate utility of taxpayers has been diminished. With this in mind, administrators often look to "results-oriented" management practices as an ethically responsible means of administration. This is contrasted with process-oriented or principle-oriented practices (see Ref.^[4]). A good example of results-oriented management is a performance-based pay system.

INTRODUCTION

Thailand has experienced frequent changes in its national government over the past 70 years, while the rapid economic growth of the 1970s and 1980s that was halted so dramatically by the 1997 Asian financial crisis has resumed once again. The 1997 constitution, through its reform of the electoral system and the establishment of a range of institutions such as the National Counter Corruption Commission (NCCC), the Constitutional Court, and the Office of the Ombudsman, provides an institutional framework to support principles of good governance. Major public administration challenges include the implementation of public service reforms such as decentralization, a continuous battle against corruption at all levels, ensuring a free media, and facilitating the further development of Thailand's civil society.

GOVERNMENT IN THAILAND

Thailand, with a population of 63.3 million, is generally regarded as a "middle income" country and, though less prosperous than its more industrialized neighbor Malaysia or the city-state of Singapore, its 2002 per capita GDP of US\$6,900 is higher than other countries in Southeast Asia (<http://unstats.un.org/unsd/demographic/social/inc-eco.htm>) (Table 1). Poverty tends to be more widespread in the countryside as industrial development has concentrated mostly in the Bangkok Metropolitan Region.

The only Southeast Asian country never colonized by a European power, Thailand is a constitutional monarchy with executive power vested in a prime minister and cabinet. Under the terms of the 1997 constitution, the bicameral National Assembly consists of a House of Representatives composed of 400 single-member districts and 100 party-list seats, all directly elected for 4-year terms, and a Senate that has 200 members directly elected for 6-year terms.

The current prime minister, Thaksin Shinawatra, is a telecommunications billionaire who has formed a coalition government from the 248 seats won by his Thai Rak Thai (Thais Love Thais, or TRT) in the 2001 general election together with three smaller

parties: two conservative and one centrist. With this comfortable parliamentary majority, Thaksin's government has greater stability than any government in modern Thai history, which between 1932 and 1992 gave rise to 50 different, and often unstable, military and civilian administrations.

There are 76 provinces in Thailand, including metropolitan Bangkok. The governor of Bangkok has been directly elected, whereas all other provincial governors have been career civil servants appointed by the Ministry of the Interior. Under this highly centralized system of public administration, most officials at provincial, district, and subdistrict level have been affiliated with central agencies. Consequently, public policy has traditionally been paternalistically developed within the centrally oriented bureaucracy, while political power has revolved around a narrow set of competing elites in the capital.

1997 CONSTITUTION

Thailand's 1997 constitution is the basis for major structural changes in the Thai political, legal, and administrative systems, although when it was approved overwhelmingly by the National Assembly the vote belied deep divisions between reformers and conservatives. It does, nevertheless, enshrine the principle of constitutional supremacy. Any law, act, or decree contrary to or inconsistent with the constitution is unenforceable, while all branches of the government are bound to ensure that the constitution's integrity is upheld.

A number of constitutional features are designed to undermine corrupt electoral practices and to reduce the fragmentation of political power among too many political parties. All candidates for election either as members of the House of Representatives or the Senate must have at least a Bachelor's degree. This measure is designed to reduce vote buying in rural areas, based on the assumption that many traditional "godfathers" (i.e., wealthy local businessmen who dominate political/economic life within a rural district) would be disqualified. All parties contesting a general election must endorse a "slate" of 100 candidates so as to help eliminate small splinter factions and, by consolidating

Table 1 Per capita GDP (US\$) 2002 (estimated), selected countries in Southeast Asia

Country	Per capita GDP (\$US)
Singapore	24,000
Malaysia	9,300
Thailand	6,900

power in the hands of a few dominant parties, help ensure governments with a degree of long-term stability.

ASIAN FINANCIAL CRISIS

The spark igniting the Asian financial crisis in July 1997 was the Thai government's failed attempt to defend the Thai baht, which was linked to the U.S. dollar, against speculators. Thailand's booming economy ground to a halt amid massive layoffs in finance, real estate, and construction that resulted in huge numbers of workers returning to their villages in the countryside and 600,000 foreign workers being sent back to their home countries. The currency was floated and the government agreed to a US\$17.2 billion bailout by the International Monetary Fund (IMF)/World Bank subject to conditionalities such as passing laws relating to bankruptcy (reorganizing and restructuring) procedures and establishing strong regulatory frameworks for banks and other financial institutions.

Thailand's economy is once again doing well and the extra tax revenue being generated should allow Thailand to balance its budget in 2004, four years ahead of schedule. Real GDP growth is expected to average 5.9% in 2003–2004, while inflationary pressures are expected to remain low and the baht to continue to be stable (<http://www.economist.com/countries/Thailand/profile.cfm?folder=Profile-Forecast>).

PUBLIC SECTOR

The Thai public sector is not particularly large. Except for Myanmar, Thailand spends a smaller portion of its GNP on the public sector than its Asian neighbors (Table 2).

Over the years, legislation has been enacted to facilitate the development of a modern civil service.

Table 2 Total expenditure on the public sector, selected countries in Southeast Asia (2000)

Rank order	Country	Expenditure (% of GDP)
1	Vietnam	23.4
2	Indonesia	20.5
3	Malaysia	19.7
4	Philippines	19.5
5	Singapore	19.1
6	Thailand	18.0
7	Myanmar	8.7

<http://www.worldbank.org/data/databytopic/publicsector.html>.

The 1975 Civil Service Act introduced a position classification system and required new recruits to take an entry examination, and the 1992 Civil Service Act outlined the role of the Civil Service Commission as the central human resources agency for the public service. However, the bureaucracy is a traditional pillar of Thai society that has exercised considerable power and enjoyed high status under both military and civilian regimes. Therefore, reform initiatives have had a limited impact on rectifying a host of shortcomings such as overcentralization, poor coordination, functional overlap (particularly at the subnational level), antiquated work processes, too much delay and discretion in implementing decisions, and lack of responsiveness and accountability to the citizenry. During the 1990s, the public sector's attempt to recruit and retain professionals was undermined by more attractive private sector salaries, particularly in key areas such as law, accounting, and computer science.

The military is also a traditional pillar of Thai society, although its role since 1992 has changed from one of exercising absolute power to that of "system stabilizer." As a more professional military has emerged, it has been less inclined to become involved directly in political affairs. Even the severe economic meltdown of the Asian financial crisis and the strong opposition within the traditional bureaucratic/military establishment to the new constitution did not provoke military intervention.

Public sector reforms designed to reduce the role of the state predate the initiatives flowing from the new constitution, although privatization of state assets was part of a package of reform measure announced when Thailand accepted its financial bailout in 1997. The long-term trend of selling off state-owned enterprises (SOEs), developing joint public/private ventures, and deregulation to encourage market competition has been boosted by the Thaksin administration's determination to move ahead with state enterprise privatization, with the caveat that enterprises responsible for key public services are to remain at least 50% owned by the government. Public

utilities, such as electricity and water, are to be under government control even after corporatization.

The 1997 constitution is designed to reduce the control of the central bureaucracy through initiatives such as decentralization and to strengthen good governance principles. The Official Information Act (1997) provides greater access to official information. One of the most visible changes in transparency is the policy on asset declaration by government officials—an issue highlighted frequently by the print media. In May 1999, the Cabinet issued its Public Sector Management Reform Plan, outlining the government's vision for institutional change under the supervision of a high-level Public Sector Reform Committee. Greater decentralization of the public sector has been a controversial issue of long-standing between politicians and bureaucrats, and it is now a key component of the democratic reform vision. A Decentralization Committee has been established, and responsibilities and funding are beginning to move away from the center of government toward special or general organizations at the local level. This is particularly the case with health, education, and local government financing.

A new bureaucratic system was launched in October 2002, consisting of 20 ministries, 61 bureaus, and 60 departments. This reform was designed to enhance government efficiency and flexibility, and reduce the chain of command. Primary objectives are to improve interdepartmental coordination and to bring together similar functions from multiple ministries.

Because of his deep distrust of, and increasing impatience with, the Thai bureaucracy's measured procedures, the Prime Minister, Thaksin Shinawatra, has now thrown his support behind the development of a chief executive officer (CEO) system, which would require senior government officials to manage their areas of responsibility like corporate CEOs. Among the first group targeted for training in this approach have been ministry permanent secretaries, department heads, chiefs of state enterprises, and some provincial governors (<http://www.kellogg.northwestern.edu/news/hits/030702tnt.htm>).

Corruption is a long-standing governance issue in Thailand, where traditional patron–client relationships and gift-giving have been widely accepted in public appointments, dealing with public officials and political campaigning. It has been the norm for government ministers to exercise patronage in relation to promotions and appointments, in particular to semigovernment Boards and authorities. Transparency International's Corruption Perceptions Index 2003 ranks Thailand 75th out of the 133 countries whose levels of corruption were charted (<http://www.transparency.org/cpi/2003/cpi2003.en.html>) (Table 3).

A major concern about the public reform decentralization initiatives concerns the capacity of the watchdog National Counter Corruption Commission (NCCC) to operate effectively against widespread corruption at the subnational level. However, unlike the corruption agency it replaces, the NCCC is an autonomous agency established apart from the Office of the Prime Minister with its own secretariat, budget, and personnel administration. Its main responsibilities are to ensure the declaration and inspection of assets and liabilities for officials holding political positions and state officials, to undertake corruption prevention and suppression activities (<http://www.nccc.thaigov.net/nccc/eng.php>). It has the power to overrule the Attorney General and initiate prosecution.

CONSTITUTIONAL COURT

The Constitutional Court is an independent body consisting of 15 full-time judges selected by a complicated process that seeks to ensure they are above political and business interests. It renders judgments on the constitutionality of the provisions of law and other powers as provided for in the Constitution and other laws.

In 2000 the NCCC found Thaksin Shinawatra, Thailand's prime minister, guilty of filing false asset statements when he was deputy prime minister in 1997 and the case was referred to the Constitutional Court for further action. A controversial eight-to-seven

Table 3 Transparency international corruption perceptions index 2003, selected countries in Southeast Asia

Country rank	Country	CPI 2003 score	Surveys used	Standard deviation	High–low range
5	Singapore	9.4	12	0.1	9.2–9.5
37	Malaysia	5.2	13	1.1	3.6–8.0
70	Thailand	3.3	13	0.9	1.4–4.4
92	Philippines	2.5	12	0.5	1.6–3.6
100	Vietnam	2.4	8	0.8	1.4–3.6
122	Indonesia	1.9	13	0.5	0.7–2.9
129	Myanmar	1.6	3	0.3	1.4–2.0

<http://www.transparency.org/cpi/2003/cpi2003.en.html>.

split in Thaksin's favor, in August 2001, averted a political crisis by allowing the prime minister to remain in office. It did, however, raise serious questions about whether the rule of law was being undermined by political expediency.

OMBUDSMAN

The Ombudsman of Thailand (<http://www.ombudsman.go.th>) established in April 2000, under the provisions of the 1997 constitution, is empowered to refer any case in violation of the constitution to either the Administrative Court or the Constitutional Court. It also has the authority to inquire into complaints about maladministration by civil servants, members or employees of government bodies, state agencies, state enterprises, or local governments.

CIVIL SOCIETY

Civil society has, during the past 20 years, expanded substantially. Participation in Thai civil society appears to be strongest among rural, older citizens with more traditional attitudes although there is a continuing growth in the numbers of non-governmental organizations (NGOs), with and without legal status, supporting issues such as environmental and wildlife protection, women's/children's rights, and student's concerns. Private foundations, business groups, and professional organizations have also developed as vehicles of expression for the concerns of the middle class.

Many civil society groups and organizations participated in the consultation exercises that led to the drafting of Thailand's 1997 Constitution, which recognizes public participation as having a legitimate role to play in shaping national policies (Chapter V, Section 76—http://www.kpi.ac.th/en/con_th5.asp). Under the new constitution, the Senate, composed of 200 members elected from geographic constituencies, is designed to reduce the influence of the bureaucracy, military, and business groups in favor of individuals more closely aligned with the community.

Thai civil society appears to be increasingly integrated into the participatory processes developed and controlled by the state in line with its "good governance" agenda rather than operating as a wholly independent critical force. For example, the government recently established the Community Organizations Development Institute (CODI) as a new type of public organization under the supervision of the Ministry of Finance (<http://www.codi.or.th>) to promote the development of community organizations and civil society by coordinating the efforts of stakeholders involved in community development.

NATIONAL ECONOMIC AND SOCIAL DEVELOPMENT BOARD

The National Economic and Social Development Board (NESDB) (<http://www.nesdb.go.th>) is Thailand's economic development agency and "think tank." It is responsible for developing the 5-year National Plans that provide a guideline for the country's medium-term economic development. A series of participatory planning exercises with the private sector, NGOs, and civil society at the regional and local levels was undertaken to develop the 9th National Plan (2002–2006) (http://www.un.or.th/Thailand_Info/Development/plan/plan.html). Its main goals of poverty alleviation, recovery with sustainability and stability, good governance, and strengthening development foundations are essentially Thailand's national priorities. In the latest plan the growing significance of civil society in the decision-making process is emphasized.

MEDIA

The print and non-print media have been credited with the role of assisting to heighten political consciousness as for example, during the televising of the constitutional debates prior to the approval of the 1997 constitution. However, Freedom House's Global Survey of Media Independence reduced Thailand's 2002 rating from Free to Partly Free because of increased pressure on media outlets by Prime Minister Thaksin Shinawatra's administration (<http://www.freedomhouse.org/research/pressurvey.htm>) (Table 4).

Table 4 Freedom house freedom of the press survey 2003,^a selected countries in Southeast Asia

Country	Status
	Free (0–30)
	Partly free (31–60)
	Not free (61–100)
Philippines	Free/21 to 30
Thailand	Partly free/31 to 40
Indonesia	Partly free/51 to 60
Singapore	Not free/61 to 70
Malaysia	Not free/71 to 80
Vietnam	Not free/81 to 90
Myanmar	No data

^aLegal environment: 0–30 points

Political influences: 0–40 points

Economic pressures: 0–30 points

Total score: 0–100 points

<http://www.freedomhouse.org/research/pressurvey.htm>.

Most radio and broadcast television stations are directly or indirectly owned or overseen by either the government or the armed forces, and, by law, radio stations must renew their licenses annually. As for newspapers, which do scrutinize official policies and report allegations of corruption and human rights abuses, they appear to be exercising a higher level of self-censorship.

CONCLUSION

The electoral system and framework of agencies established by Thailand's enlightened 1997 constitution provide a sound basis for the continuing development of good governance principles in the country. However, critical issues surround how to ensure that either the majority government or the many different "vested interests" in the public administration system do not compromise, either overtly or covertly, the potential effectiveness of the new watchdog agencies, progress toward public services reform, freedom of the media, or the active engagement of civil society in policy making processes.

Theory, Types and Attributes of

Jeffrey A. Weber

Department of Political Science, East Stroudsburg University, East Stroudsburg, Pennsylvania, U.S.A.

INTRODUCTION

Theory has come to mean different things to different people.^[1] Kerlinger,^[2] for example, views theory as a “set of interrelated constructs, definitions, and propositions that present a systematic view of phenomena by specifying relations among variables, with the purpose of explaining and predicting the phenomena.” While Kaplan^[3] viewed theory as an “explanation of something” through its “relationship with other elements” in such a way that it “formed a unified whole.” Weick^[4] offers another view of theory as an approximation of a phenomenon that begins as a “non-linear vision” and is converted into related constructs and propositions. He contends that a theory is never complete but always a work in progress.^[1]

Despite these different meanings, there does appear to be some commonality in the overall understanding of what is a theory. Therefore, based on some of the commonalities, a theory is defined as: An explanation of a phenomenon or phenomena through a set of inter-related constructs.

TYPES OF THEORY

Just as theory can have different meanings, so there are different typologies for theories.^[3,5] Some categorize theories by analytical process—deductive, inductive, pattern, or grounded.^[1,6] Others categorize theories by scope and level of generalizability.^[1,6]

Drawing from these works, theories can be grouped into four types: grand, general, middle-range, and substantive.

Grand Theory

Grand theory is a system of interrelated abstract concepts and propositions that comprehensively describe and explain large categories of phenomena non-probabilistically. A grand theory lays out proposed universal laws that guide the interrelationship of the concepts comprising the phenomena.^[1,6]

There are many examples of grand theories in both the natural and social sciences. Etzioni^[7] developed a

grand theory concerning the “societal and political processes.” Einstein^[8] and Hawking^[9] developed grand theories that explained matter, space–time, and energy. Parson’s^[10] “structure of social action” was a grand theory explaining a societal system. While, most recently, Wilson^[11] has presented a grand theory involving the “unity of knowledge.”

A grand theory involves a possible explanation of phenomena. While this explanation is broad and generalizable, in order to be useful, the grand theory must be complete, meaning addressing the whole of the phenomena. Grand theories serve the body of knowledge by providing an overall guide to the study of the individual phenomenon that comprise the phenomena.

General Theory

The term, “general theory” has previously been used (i.e., general theory of relativity), but, while the theory-building literature addresses what a theory is in the broad sense, as well as different types of theory and multiple definitions of theory, a specific definition for general theory has yet to be offered.

A general theory is a form of grand theory, except instead of dealing with phenomena, a general theory focuses on a phenomenon. Synthesizing from previous use of the term general theory, the following definition was developed:

- A coherent narrative composed of assumptions, abstract reasoning, and speculation that describes, defines, and explains the whole of an observed or experienced phenomenon’s main constructs, their interrelationships, and their boundaries in a broad and generalizable scope that is applicable to the whole of the phenomenon regardless of academic discipline.^[4,12,13]
- General theory would be a type of theory that lies in between grand theory and middle-range theory. While grand theory deals with interrelationships of phenomena, a general theory deals with a specific phenomenon. It is different from middle-range theory, in that it covers the whole of the phenomenon and it is not discipline specific.

Middle-Range Theory

Middle-range theory is “more limited in scope than a grand theory” or a general theory.^[6] It is derived from a general theory by a particular academic discipline that is studying a single concept, which is a part of the phenomenon being explained by the general theory.

Middle-range theories are sometimes referred to as formal theories or theoretical models.^[5] Formal theories and theoretical models are composed of boundaries, constructs, and propositions. These form a detailed explanation of a concept, which can be tested and verified.

The boundaries of middle-range theories are more defined and specified than general theories. Middle-range theory boundaries are within the general theory boundaries but narrow to focus on a single concept and its constructs. A construct is defined as a “mental configuration,” which “though not observational either directly or indirectly, may be applied or even defined on the basis of observables.”^[12] The constructs of middle-range theory flow directly from the concepts that comprise the grand theory.

Furthermore, the interrelationships between constructs in middle-range theories are defined through propositions. Quantitative research methods are easily applied because the unit of analysis is limited in time and space.

Examples of middle-range theories are Trist and Emery's^[14] sociotechnical theory explaining the concept of effective organizations; also, Downs's^[15] bureaucratic life-cycle model and Lindblom's^[16] incrementalism. The verification of a middle-range theory involves breaking it down further into a substantive theory so that it may be tested.

Substantive Theory

Substantive theory is “restricted to features of populations, settings, and times that can be concretely identified.”^[6] A substantive theory is based on a middle-range theory, and it seeks to describe, in great detail, the interrelationships among the middle-range theory's constructs. Substantive theories represent the operationalizing of a grand theory.

Variables comprise the primary building block's of substantive theory. Variables are “an observable entity” that “may be viewed as an operational configuration derived from a construct.”^[12] Furthermore, variables consist of indicators that are specific measurable components.

Hypotheses define the relationships between the variables. Hypotheses are refinements of proposition statements in the middle-range theory but are

“more concrete and operational statements of these relationships.”^[12]

Additionally, narrow “typologies or categorical systems” can be defined as substantive theories. Typically, if one is building theory, from data, such as grounded theory, the data must first be categorized, and this marks the beginning of a substantive theory.

ATTRIBUTES OF THEORY

Basically, there are two schools of thought concerning the attributes of theory. One school of thought contends that there is a single set of rigid attributes that must be met in order to be classified as a theory. The opposing school of thought argues that a theory is ever changing and developing, therefore, it can have a variety of attributes.

Single Set of Qualities

Sutton and Staw^[17] have argued that theory is much maligned and misused, and this situation has resulted in practically any speculation being called a theory. Furthermore, Sutton and Staw argue that lack of consensus on what is a theory has led to disorganization within the body of knowledge. Therefore, theory must be defined clearly because just as “a collection of words does not comprise a sentence,” a collection of thoughts, speculations, assumptions, and data does not make a theory.^[12]

Therefore, what qualifies as a theory is very limited in scope and must meet stringently defined characteristics. Theories must contain boundaries, constructs, propositions explaining the relationship between constructs, variables that comprise the constructs, and hypotheses that explain the relationship among the variables. Furthermore, a theory must have “logical adequacy,” be non-tautological, and have empirical adequacy.^[12,18] Finally, a theory must have utility and provide a mechanism for “prediction beyond chance.”^[12]

While specifically defining what is a theory prevents every metaphor or speculation from being termed a theory, there is a risk of having too stringent a definition, which then limits one to only substantive theory. Thus, details are explained without ever explaining the overall phenomenon that connects them.

Variety of Qualities

Seeming to contradict the above viewpoint is the idea that we are afraid to use the word, “theory.” Weick^[4] contends that academics will go to any extreme

possible to state that they are not putting forth a theory because it does not fit some particular definition of “good theory.” Furthermore, there is the fear of merciless criticisms that the theory is not deep enough in its explanation or that the theory is not broad enough to be generalizable.

DiMaggio^[19] proposes a solution to the above dilemma by pointing out that “theory is a continuum.” He states that theories are approximations of phenomenon that begin as “non-linear visions,” and are converted into detailed constructs and propositions. As one moves a theory from a vision to detailed constructs and propositions, the theory loses accuracy and precision and becomes more of an approximation, but at the same time, it becomes increasingly concrete. Thus, it is “difficult to judge” what is a theory, because “theory work can take a variety of forms,” and it is a work in progress.^[4,20] Therefore, to recognize what is a theory requires considering the process by which the theory is being developed.

The process of theorizing consists of the following activities: abstracting, generalizing, relating, selecting, explaining, synthesizing, and idealizing.^[4] To know if one is developing a theory, one has to know the “context of what came before and what comes next.”^[4] If a researcher, seeking to explain a phenomenon, moves from one part of the process to another part, then theory building is taking place. “Few things are full-fledged theories” but, there are many developing theories, which are moving through the process.^[4]

Common Attributes of Theory

Regardless of the school of thought followed in trying to understand the attributes of theory, there does appear to be some commonalities between the “single set of attributes” and the “variety of attributes” schools of thought. First, a theory does have the attribute of some kind of context or boundary. Consequently, there appear to be three boundaries for a theory: first, the paradigm of the theory builder (paradigm is used in the sense of a overarching perspective that encompasses the values and thought process of the theory builder); second, the amount of time encompassed by the theory; and, third, the amount of space taken by the phenomena or phenomenon the theory seeks to explain.

Second, within those boundaries, a theory is composed of constructs, which are abstract conceptualizations, which serve as a part of the explanation within the theory. As defined earlier, a theory is an explanation of a phenomenon or phenomena. The explanation is composed of parts, and it is these parts that are defined as constructs.

Third, there are interrelationships among the constructs that, when combined with the boundaries and the constructs, serve to complete the explanation of the phenomenon or phenomena. These interrelationships can take numerous forms and many different words are used to express them, such as hypotheses or associations. What the interrelationships are ultimately

Fig. 1 Components of a theory.

called is based on the values and perspective of the theorist(s).

Fig. 1 depicts the attributes of a theory. The boundaries (paradigm, time, and space) are shown as an oval. Three constructs are depicted within the boundaries, along with their interrelationships.

CONCLUSION

The division of theory into four types is meant as a heuristic device rather than a rigid framework. This fourfold typology allows categorizing of theories in order to facilitate their study. It has been stated that almost all theories easily fall into one of the four types: grand, general, middle-range, and substantive. Furthermore, the typology permits one to understand how theories contribute to the body of knowledge. Regardless of the perspective of the theorist, theories consist of the following attributes: boundaries (paradigm, time, space), constructs, and interrelationships among the constructs.

Third-Party Interventions

R. Wayne Boss

Leeds School of Business, University of Colorado at Boulder, Boulder, Colorado, U.S.A.

Mark L. McConkie

Graduate School of Public Affairs, University of Colorado at Colorado Springs, Colorado Springs, Colorado, U.S.A.

INTRODUCTION

Third-party intervention is a method of resolving conflicts between two or more people when those conflicts involve interpersonal issues that significantly disrupt necessary processes and work relationships, typically with a trained resource. Not all conflict is bad: Creative conflict can enhance motivation and innovation and help group members understand unfamiliar ideas or points of view. Also, not all conflict is interpersonal. When conflict involves substantive issues, such as work methods, pay rates, conditions of employment, and competition for scarce resources, conflict resolution interventions often involve settling labor-management disputes through arbitration and mediation—methods that require considerable training and expertise in law and labor relations. Even when the conflict is interpersonal and counterproductive, it may not be severe or disruptive enough to warrant attention. In some instances, the parties may resolve the conflict themselves, or managers may resolve the conflict unilaterally—for example, when they are under heavy time pressures, when the disputants are not expected to work together in the future, or when resolution of the dispute has a broad effect on the organization.

The third-party intervener must be highly sensitive to his or her own feelings and to those of the others. He or she also must recognize that some tension and conflict are inevitable and that although there can be an optimum amount and degree of conflict, too much conflict can be dysfunctional for both the people involved and the larger organization. The third-party consultant must be sensitive to the situation and able to use a number of different intervention strategies and tactics when intervention appears to be useful. Finally, he or she must have professional expertise in third-party intervention and must be seen by the parties as neutral or unbiased regarding the issues and outcomes of the conflict resolution.^[1]

THE ROLE OF CONFRONTATION

Central to successful third-party interventions is the concept of confrontation. People must be willing to both accept the fact that conflict exists between them and to confront that conflict in constructive ways. Walton describes the elements for successful confrontation:^[2]

1. Mutual positive motivation: both parties want to resolve the conflict
2. Balance in the situational power of the two principles (the parties hold approximately equal power positions)
3. Synchronization of their confrontation efforts: the parties are ready to resolve the problem and agree on a process for doing so
4. Appropriate pacing of the differentiation: clarifying their differences and integration (identifying commonalities and mutual goals) phases of a dialog ensure that they allow adequate time to work through and clarify their negative feelings
5. Conditions favoring openness in dialog: agreement beforehand about honesty and openness
6. Reliable communicative signs: making certain that people can understand one another
7. Optimum tension in the situation (both parties should be experiencing stress in the relationship, since no meaningful change can take place without it).

THIRD-PARTY CONSULTANTS

When the conflict is interpersonal in nature, however, and when it destroys trust and prevents people from working together, third-party approaches may help control and resolve it. Interpersonal issues include personality differences, task orientation, communication problems, and misperceptions.

Third-party consultants help the parties interact with each other directly, facilitate the diagnosis of their conflict, and help identify ways to resolve it. Cummings and Worley summarize the characteristics of effective third-party consultant in the following way:

The third-party consultant must develop considerable skill at diagnosis, intervention, and follow-up.

A MODEL FOR THIRD-PARTY FACILITATION

A basic and typical model for third-party facilitation includes perception sharing, problem identification, contracting, and follow-up meetings.^[3]

Perception Sharing

The parties are asked to take a few minutes and respond to such questions as these:

1. What does the other person do well?
2. What do I think I do that bothers the other person?
3. What does the other person do that bothers me?

Both parties then take turns explaining their responses to the facilitator and the other person.

This design has several benefits, as an outline reflects:

- The process of writing down specific behaviors that each person likes and dislikes forces an element of rationality into an otherwise emotionally charged interchange; subjective, evaluative statements and gross generalizations are no longer acceptable.
- Just taking the time to write things down helps diffuse the hostility and allow each party to cool off. Since the design guarantees that both will be able to tell their side of the story without interruption, they are more inclined to listen.
- In listing their observations, conflicting parties realize that the things that actually bother them about each other are not nearly as unchangeable as they had imagined.
- The design allows both parties to concentrate on the positive aspects of their relationship, which often surprises them. Those positive comments help mitigate the hostility and establish a climate of cooperation.
- The second question forces them to examine their own behavior and to specify what they did that caused problems for the other person—something neither party is typically willing to do.

Problem Identification

The responses to question 3 are then listed, and the parties assign vectors of different lengths to indicate the seriousness of each: the longer the vector, the more serious the problem. In most cases, the parties are surprised with what they see, since people often have no idea what they are doing to cause problems for the other person. Usually they find that some behaviors that cause serious problems can be corrected immediately, while others take longer.

Contracting

The purpose of contracting is to ensure that specific steps will be put in place to resolve the problems. Specifically, for each problem, the parties are asked to respond to two questions:

1. What will I do to resolve this problem?
2. What will the other person do to help me succeed?

This approach gives both parties a vested interest in resolving the problems and helps promote a spirit of cooperation. Both parties define the specific behaviors they want the other to change and then negotiate the things that they are willing to change. The consultant facilitates the process and documents the decisions.

Follow-Up Meetings

Since meaningful change is impossible without mechanisms for reinforcement, the parties schedule follow-up meetings to monitor their progress, to hold one another accountable, and to address issues that may subsequently arise. These meetings usually last no more than a couple of hours and, depending on the level of progress, the third-party consultant may or may not attend.

Results of the Intervention

When properly conducted, this intervention can have a long-term, successful impact on dysfunctional relationships. For example, Boss, McConkie, and Golembiewski^[4] report the results of a third-party intervention between the director of an operating room and the chief surgeon in a major medical center. Positive outcomes included significant improvements in their levels of interpersonal trust and cooperation with one another and in 10 key behaviors that impacted their relationships. Three hospital administrators, who also evaluated their effectiveness, reported similar results. Further, these positive results were maintained for 14 years, as indicated by reports from both the participants and observers. Additional positive outcomes in the operating room included a resolution to the orthopedic prostheses problem, improved scheduling of surgical procedures, a decrease in verbal abuse by physicians, the reconvening of the operating room standards committee, and a significant reduction in turnover of operating room nurses.

WORDS OF CAUTION

Third-party interventions in conflict situations have the potential not only to control the conflict but to also resolve it, to the point that conflicting parties can develop long-term, positive relationships with one

another. However, the “intervention into interpersonal conflict situations requires a highly skilled professional or a highly skilled layperson who understands the dynamics of conflict. This intervention should not be undertaken by a novice in human and social processes of organizations.”^[5]

Time Value of Money

John D. Wong

*Hugo Wall School of Urban and Public Affairs, Wichita State University,
Wichita, Kansas, U.S.A.*

INTRODUCTION

According to economics, the value of a commodity is directly related to its scarcity relative to demand. The concept of the *time value of money* is based on the fact that most people would prefer to receive a given sum of money today than the same amount at some time in the future. If nothing else, receiving the money now potentially affords additional opportunities that may not be available later. Also, money held today is worth more than a promise of payment in the future because of the risk that the payment may not be made in the future and because cash held today could be invested to earn a return in the future. Time value analysis has many applications, ranging from setting up schedules for paying off debt to decisions about whether to acquire new equipment. When an organization acquires a capital asset, it must either borrow the funds needed for the acquisition or use resources currently held by the organization. In the first case, the organization would be paying interest over the life of the loan. In the second case, the organization would be foregoing the return that it could have earned from using those resources in their next best alternative use.

CONCEPT OF INTEREST

The time value of money derives from the concept of interest. *Interest* is the return earned by or the amount paid to another party that has foregone other opportunities and chooses instead to make money available to the other party. In other words, interest is the fee assessed for the privilege of borrowing the money of another or the fee obtained for loaning money to another. The *principal* is the amount of money borrowed, loaned, or invested. The *term* is the length of time or number of time periods during which the borrower can use the principal, i.e., the duration of the loan. The *rate of interest* is the percentage of the principal that the borrower must pay the lender for each time period as compensation for foregoing other opportunities. The *nominal interest rate* is the periodic rate of interest that is stated in the loan agreement

or security. The *market interest rate* is comprised of three components:

- The *real rate of interest* compensates the lender for not being able to use the money during the term of the loan.
- An *inflation premium* compensates the lender for the possibility that inflation may erode the purchasing power of the money during the term of the loan.
- A *risk premium* compensates the lender for the possibility that the loan may not be repaid in full.

The real rate of interest and an inflation premium are sometimes referred to collectively as the *nominal risk-free rate*. In the United States, the nominal risk-free rate can be approximated by the rate on 13-week U.S. Treasury bills, because they are generally considered to be risk free.

An important concept involving the time value of money is that a single lump sum of money or a stream of equal, evenly spaced payments or receipts promised in the future can be converted to an equivalent value today. Conversely, a single lump sum or a series of future payments can be converted to its equivalent value in the future. To take into account the time value of money, the present stock of money may be converted to a future flow of money, or the future flow of money may be converted to a present stock of money.

The process of converting the present stock of money into a future flow of money focuses on the concept of *compounding*, while the process of converting the future flow of money into a present stock of money focuses on the concept of *discounting*. Computationally, both methods will produce equivalent results for decision-making purposes. However, there are conceptual and pedagogical advantages to discounting future flows to present value.

However, it should be kept in mind that the concepts of compounding and discounting are not premised specifically on adjusting for the effect of inflation or uncertainty, but rather focus on the recognition that a given amount of money possessed today is more valuable than that same amount to be received in the future. Current value cash flows should be discounted by the nominal interest rate, while real cash flows should be discounted by the real interest rate.

Table 1 Simple interest

Year	Beginning value	Interest	Ending value
1	\$10,000	10% of \$10,000 = \$1000	+\$10,000 = \$11,000
2	\$10,000	10% of \$10,000 = \$1000	+\$11,000 = \$12,000
3	\$10,000	10% of \$10,000 = \$1000	+\$12,000 = \$13,000
4	\$10,000	10% of \$10,000 = \$1000	+\$13,000 = \$14,000
5	\$10,000	10% of \$10,000 = \$1000	+\$14,000 = \$15,000

Simple Interest

Simple interest is paid or received on the principal sum only. Accumulated interest from prior periods is not used in calculations for the following periods. The amount of simple interest (I) is equal to the product of the principal or present value (PV_0) times the interest rate per time period (i) times the number of time periods (n). Although the examples presented here are denominated in dollars (USD, \$), using alternative currency units [e.g., British Pounds Sterling (GBP, £), European Union Euros (EUR, €), or Japanese Yen (JPY, ¥)] will not alter the result.

Example: $PV_0 = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
 I &= PV_0 \times i \times n \\
 &= \$10,000 \times 0.10 \times 5 \\
 &= \$5000
 \end{aligned}$$

In this example, \$10,000 invested or borrowed at a 10% simple interest rate will result in \$1000 of interest at the end of one year. After five years, the investment or loan will result in a total of \$5000 in interest plus the original principal amount (see Table 1).

Compound Interest

Compound interest is paid or received not only on the principal but also on any interest earned and not withdrawn during earlier periods. Compound interest may be thought of as a series of single-period, simple-interest contracts. The interest earned in each period is added to the principal of the previous period

to become the principal for the next period. Because interest is paid on interest as it accumulates, compound interest will result in more interest than simple interest.

In the example shown in Table 2, \$10,000 invested or borrowed at a 10% compound interest rate will result in \$1000 of interest at the end of one year. For the second through fifth years, the compound interest computations are based on the original principal plus the interest accrued during the following period. After 5 years, the investment or loan will result in a total of \$6105 in interest plus the original principal amount.

Rule of 72

The *rule of 72* may be used to approximate the time period (n) needed for money to double in value or the interest rate (i) needed for money to double in a given number of years. According to the rule of 72, the number 72 may be divided by the interest rate to determine the approximate number of years it would take for a sum of money to double in value. For example, because $n = 72/i$, it would take 9 years for a sum of money to double in value at an interest rate of 8%. Likewise, the number 72 may be divided by the number of years to determine what interest rate would be necessary to double the value of a given sum of money, e.g., because $i = 72/n$, an interest rate of 8% would be required for a sum of money to double in value after 9 years. The closer the rate of interest is to 8%, the more accurate is the estimate given by the rule. However, the accuracy of the rule diminishes progressively as the interest rate rises over 8%. For interest rates of 20% or higher, an analogous rule of 78 is sometimes used for approximation.

Table 2 Compound interest

Year	Beginning value	Interest	Ending value
1	\$10,000	10% of \$10,000 = \$1000	+\$10,000 = \$11,000
2	\$11,000	10% of \$11,000 = \$1100	+\$11,000 = \$12,100
3	\$12,100	10% of \$12,100 = \$1210	+\$12,100 = \$13,310
4	\$13,310	10% of \$13,310 = \$1331	+\$13,310 = \$14,641
5	\$14,641	10% of \$14,641 = \$1464	+\$14,641 = \$16,105

A more precise result may be obtained by using natural logarithms. To find the number of periods (n) necessary for a given present value (PV_0) to increase to a certain future value (FV_n) at an interest rate of (i), the following may be used: $n = \ln(FV_n/PV_0)/\ln(1 + i)$. For example, it will take 9 years for \$10,000 to double in value at an interest rate of 8% compounded annually.

$$\begin{aligned} n &= \ln(20,000/10,000)/\ln(1 + 0.08) \\ &= \ln(2)/\ln(1.08) = 9 \text{ years} \end{aligned}$$

FUTURE VALUE

Future value (FV_n) is the amount to which an investment made today (present value) will grow after earning compound interest for a number of periods. The difference between the future value and the present value depends on the number of compounding periods involved and the interest rate. The future value includes the principal plus interest accumulated at the end of the term of the loan. The relationship between future value and present value can be expressed as follows:

$$\begin{aligned} FV_n &= PV_0 + I \\ &= PV_0(1 + i)^n \end{aligned}$$

where:

FV_n = Future value.
 I = Annual interest payment.
 PV_0 = Present value.
 i = Interest rate per period.
 n = Number of periods.

Example: $PV_0 = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned} FV_n &= PV_0(1 + i)^n \\ &= \$10,000(1 + 0.10)^5 \\ &= \$10,000(1.10)^5 \\ &= \$10,000(1.6105) \\ &= \$16,105 \end{aligned}$$

In this example, \$10,000 invested or borrowed at a 10% compounded interest rate will be worth \$16,105 at the end of 5 years.

Future value interest factors (FVIFs) are commonly programmed into spreadsheet functions and financial calculators and reproduced in tables. The FVIF is the future value of \$1 at the end of (n) periods at a compound interest rate of (i) percent per period.

Table 3 presents FVIFs for up to 30 periods and interest rates up to 10%. To use the table, simply go down the left-hand column to locate the appropriate number of periods. Then go out along the top row until the appropriate interest rate is located.

Multiple Compoundings per Period

Although the interest may be stated as a yearly rate, the compounding periods can be *annually*, *semiannually*, *quarterly*, or even *continuously*. If a cash flow is compounded more frequently than annually, then intrayear compounding is being used. To adjust for intrayear compounding, the interest rate per compounding period must be found as well as the total number of compounding periods. The interest rate per compounding period is found by dividing the annual rate by the number of times per year the cash flows are compounded. The total number of compounding periods is found by multiplying the number of years by the number of times per year cash flows are compounded. Notice that the formula reflects more frequent compounding (n^*m) at a lower interest rate per period (i/m). As (m) approaches infinity, the term $(1 + i/m)^{m^*n}$ approaches (e^{i^*n}), where (e) is equal to Euler's number (approximately 2.71828), and the future value becomes ($PV_0 * e^{i^*n}$). As such, continuous compounding results in the maximum possible future value at the end of (n) periods for a given rate of interest (i). However, note that although compounding multiple times during a time period will increase the interest yield, compounding continuously will not yield an infinite amount of interest.

$$FV_n = PV_0(1 + i/m)^{m \times n}$$

where:

FV_n = Future value.
 PV_0 = Present value.
 i = Interest rate per period.
 m = Compoundings per period.
 n = Number of periods.

Example: $PV_0 = \$10,000$; $i = 10\%$; $m = 12$ compoundings per period; $n = 5$ years

$$\begin{aligned} FV_n &= PV_0(1 + i/m)^{m \times n} \\ &= \$10,000(1 + 0.10/12)^{12 \times 5} \\ &= \$10,000(1 + 0.008333)^{60} \\ &= \$10,000(1.008333)^{60} \\ &= \$10,000(1.6450) \\ &= \$16,450 \end{aligned}$$

Table 3 Future value interest factors (FVIF) for \$1 at interest rate (*i*) for (*n*) years

Year	1%	2%	3%	4%	5%	6%	7%	8%	9%	10%
1	1.0100	1.0200	1.0300	1.0400	1.0500	1.0600	1.0700	1.0800	1.0900	1.1000
2	1.0201	1.0404	1.0609	1.0816	1.1025	1.1236	1.1449	1.1664	1.1881	1.2100
3	1.0303	1.0612	1.0927	1.1249	1.1576	1.1910	1.2250	1.2597	1.2950	1.3310

30	1.3478	1.8114	2.4273	3.2434	4.3219	5.7435	7.6123	10.0627	13.2677	17.4494

Example: $PV_0 = \$10,000$; $i = 10\%$; $m = 365$ compoundings per period; $n = 5$ years

$$\begin{aligned}
 FV_n &= PV_0(1 + i/m)^{m \times n} \\
 &= \$10,000(1 + 0.10/365)^{365 \times 5} \\
 &= \$10,000(1 + 0.0002740)^{1825} \\
 &= \$10,000(1.0002740)^{1825} \\
 &= \$10,000(1.64869) \\
 &= \$16,486.90
 \end{aligned}$$

Example: $PV_0 = \$10,000$; $i = 10\%$; $m = \text{continuous compounding}$; $n = 5$ years

$$\begin{aligned}
 FV_n &= PV_0 \times e^{i \times n} \\
 &= \$10,000(e)^{0.10 \times 5} \\
 &= \$10,000(2.71828)^{0.5} \\
 &= \$10,000(1.64871) \\
 &= \$16,487.10
 \end{aligned}$$

As can be seen from [Table 4](#), simple interest increases linearly, while compound interest grows

geometrically. The effect of compounding is modest over short periods of time but becomes quite significant over longer periods of time. As can be seen in [Table 4](#), compound interest grows much more rapidly than simple interest. However, the increased growth from compounding interest monthly rather than annually is significantly less than the difference between simple interest and compounding annually. The increased growth from compounding interest daily rather than monthly is almost negligible.

Effective Interest Rate

The *effective interest rate* (i_e) is the actual rate of interest paid by the borrower or earned by the lender. To make a valid comparison between two interest rates when different compounding periods are used, both nominal interest rates must be converted to their equivalent effective rates. The effective rate will always be higher than the nominal or stated interest rate, when interest is compounded more than once per year. As the number of compounding periods increases, the difference between the nominal and effective rates will also increase. However, the size of the increases diminishes with each additional compounding. In many cases, higher effective annual

Table 4 Future value of a \$1 investment at 10% interest

Year	Simple interest	Compounded annually	Compounded monthly	Compounded daily	Compounded continuously
1	\$1.10	\$1.10	\$1.10	\$1.11	\$1.11
2	\$1.20	\$1.21	\$1.22	\$1.22	\$1.22

30	\$4.00	\$17.45	\$19.84	\$20.08	\$20.09

yield may result from a lower nominal interest rate combined with more frequent compounding than from a higher nominal interest rate with no or less compounding. To convert a nominal rate to an equivalent effective rate: $i_e = [1 + (i/m)]^m - 1$, where i_e = effective interest rate, i = nominal or stated interest rate, and m = number of compounding periods per year. For example, a nominal interest rate of 10% compounded daily would result in an effective interest rate of 10.52%.

$$[i_e = [1 + (i/m)]^m - 1 = [1 + (0.10/365)]^{365} - 1 = 0.1052 = 10.52\%]$$

PRESENT VALUE

Present value is the value today of a future cash flow or cash flow equivalent evaluated at the appropriate interest rate. The process of computing present values is also sometimes referred to as discounting. Discounting is just the opposite of compounding. Because sums of money are worth different amounts at different times, they can be compared only if they have the same time

reference. The most convenient time reference is usually the present. The farther the payment date is in the future, the less it is worth today. The present value of a sum to be received in the future decreases and approaches zero as the payment date is extended further into the future, and also, the rate of decrease is greater the higher the discount rate. At relatively high discount rates, money to be received in the future is worth little today, and even at a relatively low interest rate, the present value of money due in the distant future is still small. As such, the present value increases whenever the interest rate decreases. Also, the present value increases when the number of periods of discounting decreases. In other words, the change in the present value is inversely related to changes in the interest rate or the number of periods.

When computing present values, the relevant interest rate is referred to as the *discount rate*. The present value of a future payment is the amount of money that would make the recipient feel indifferent to receiving the present value now or receiving the future value later. All other things being equal, a safe sum of money is more valuable than a risky one. The *opportunity cost rate* is the expected rate of return on the next best use of the money with comparable risk. Therefore, the appropriate

discount rate should approximate the opportunity cost of using the money. The discount rate is not the expected inflation rate. A common discount rate used by many governments is the tax-exempt rate of borrowing. Alternatively, other governments employ the rate received for the investment of public funds. Yet other governments assume that the next best use of the funds is a tax cut. In this case, an even higher discount rate may be appropriate. However, there is no precise way to determine a uniformly appropriate discount rate. The higher the discount rate, the more quickly the impact of future effects is diluted. Thus, increasing the discount rate reduces the present value of any future effect.

Present values can be computed by using the future value relationship employed previously. Because $FV_n = PV_0(1 + i)^n$, present values can be derived by rearranging the relationship and solving for PV_0 :

$$PV_0 = FV_n[1/(1 + i)^n]$$

where:

PV_0 = Present value.

FV_n = Future value.

i = Interest rate per period.

n = Number of periods.

Example: $FV_n = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned} PV_0 &= FV_n[1/(1 + i)^n] \\ &= \$10,000[1/(1 + 0.10)^5] \\ &= \$10,000[1/(1.10)^5] \\ &= \$10,000[0.6209] \\ &= \$6209 \end{aligned}$$

In this example, investing \$6209 today at 10% compounded interest would yield \$10,000 at the end of 5 years.

Because of the complexity of present value calculations, *present value interest factors* (PVIFs) are commonly programmed into spreadsheet functions and financial calculators and reproduced in tables. The PVIF is value today of \$1 payable or receivable (n) periods in the future discounted at a compound interest rate of (i) percent per period. Because of this, all PVIFs will be less than one. Therefore, when multiplying a future value by these factors, the future value is discounted down to present value. PVIFs can be derived by taking the reciprocal of the respective future value interest factors ($1/FVIF$) in Table 3.

When the present value, future value, and number of periods are known, the interest rate or rate of return can be computed:

$$i = (FV/PV)^{1/n} - 1$$

Example: $FV_n = \$10,000$; $PV_0 = \$6209$; $n = 5$ years

$$\begin{aligned} i &= (FV/PV)^{1/n} - 1 \\ &= (10,000/6209)^{1/5} - 1 \\ &= (1.6106)^{0.2} - 1 \\ &= 1.1000 - 1 \\ &= 0.10 \\ &= 10\% \end{aligned}$$

In this example, investing \$6209 today in return for \$10,000 at the end of 5 years will result in a rate of return of 10%.

ANNUITIES

An *annuity* is a series of equal deposits, withdrawals, payments, or receipts that occur at evenly spaced time intervals. Monthly salaries, monthly leases or rental payments, payments from retirement accounts, quarterly dividends payments, semiannual bond interest payments, and annual life insurance premiums all involve annuities. An *ordinary annuity* (annuity in arrears) has payments or receipts at the end of each period. An *annuity due* (annuity in advance) has payments or receipts occur at the beginning of each period.

Future Value of an Ordinary Annuity

The *future value of an ordinary annuity* is the value that a stream of future payments or receipts will grow to after a given number of periods at a specific compound interest rate. The future value of an ordinary annuity can be determined by computing the future value of each individual payment in the series using the future value formula and then summing the results. Similarly, the future value of a series of uneven payments or receipts can be found by compounding each payment to the end of the stream and then summing the future values.

$$\begin{aligned} FV_{1...n} &= FV_{n-1} + \cdots + FV_2 + FV_1 + FV_0 \\ &= [R(1 + i)^{n-1}] + \cdots + [R(1 + i)^2] \\ &\quad + [R(1 + i)^1] + [R(1 + i)^0] \end{aligned}$$

where:

FV_n = Future value in time period (n).

R = Annuity or rental payment per period.

i = Interest rate per period.

n = Number of periods.

Example: $R = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
 FV_{1...5} &= FV_4 + FV_3 + FV_2 + FV_1 + FV_0 \\
 &= [R(1+i)^4] + [R(1+i)^3] + [R(1+i)^2] \\
 &\quad + [R(1+i)^1] + [R(1+i)^0] \\
 &= [\$10,000(1+0.10)^4] + [\$10,000(1+0.10)^3] \\
 &\quad + [\$10,000(1+0.10)^2] \\
 &\quad + [\$10,000(1+0.10)^1] \\
 &\quad + [\$10,000(1+0.10)^0] \\
 &= [\$10,000(1.10)^4] + [\$10,000(1.10)^3] \\
 &\quad + [\$10,000(1.10)^2] + [\$10,000(1.10)^1] \\
 &\quad + [\$10,000(1.10)^0] \\
 &= [\$10,000(1.4641)] + [\$10,000(1.331)] \\
 &\quad + [\$10,000(1.21)] + [\$10,000(1.1)] \\
 &\quad + [\$10,000(1)] \\
 &= \$14,641 + \$13,310 + \$12,100 + \$11,000 \\
 &\quad + \$10,000 \\
 &= \$61,051
 \end{aligned}$$

In this example, depositing \$10,000 at the end of each of the next 5 years at an annually compounded interest rate of 10% will yield \$61,051 at the end of 5 years.

Future value interest factors for annuities (FVIFAs) are commonly programmed into spreadsheet functions and financial calculators and reproduced in tables. The FVIFA is the future value of a series \$1 payments or receipts per period after (n) periods at a compound interest rate of (i) percent per period. FVIFA can be computed directly using the following formula:

$$FVIFA_n^i = [(1+i)^n - 1]/i$$

Example: $R = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
 FVIFA_5^{0.10} &= [(1+0.10)^5 - 1]/0.10 \\
 &= 6.1051 \times \$10,000 = \$61,051
 \end{aligned}$$

In this example, depositing \$10,000 at the end of each of the next 5 years at a compound interest rate of 10% will yield \$61,015 at the end of 5 years.

When the future value, interest rate, and number of periods of an ordinary annuity are known, the periodic annuity payment may be determined:

$$R = FV_0 / \{[(1+i)^n - 1]/i\}$$

Example: $PV_n = \$61,051$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
 R &= \$61,051 / \{[(1+0.10)^5 - 1]/0.10\} \\
 &= \$61,051 / \{[(1.10)^5 - 1]/0.10\} \\
 &= \$61,051 / \{[(1.61051) - 1]/0.10\} \\
 &= \$61,051 / \{0.61051/0.10\} \\
 &= \$61,051 / \{6.1051\} \\
 &= \$10,000
 \end{aligned}$$

In this example, in order to accumulate \$61,051 at the end of 5 years, \$10,000 would need to be deposited at the end of each of the next 5 years, earning 10% interest compounded annually.

Present Value of an Ordinary Annuity

The *present value of an ordinary annuity* is the amount which, if invested with compound interest, would generate a stream of equal payments or receipts at evenly timed intervals. More specifically, the present value of an ordinary annuity is the amount that must be invested today at a specific interest rate so that an equal amount may be withdrawn at the end of each period, such that the original principal and all accumulated interest will be completely exhausted at the end of the annuity. The present value of an ordinary annuity can be determined by computing the present value of each payment in the series using the present value formula and then summing the results. Similarly, the present value of a series of mixed value payments or receipts can be found by summing the present values of the individual payments.

$$\begin{aligned}
 PV_{1...n} &= PV_1 + PV_2 + PV_3 + \cdots + PV_n \\
 &= [R/(1+i)^1] + [R/(1+i)^2] \\
 &\quad + [R/(1+i)^3] + \cdots + [R/(1+i)^n]
 \end{aligned}$$

where:

PV_0 = Present value.

R = Annuity or rental payment per period.

i = Interest rate per period.

n = Number of periods.

Example: $R_n = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
 PV_{1...n} &= PV_1 + PV_2 + PV_3 + \cdots + PV_n \\
 &= [R/(1+i)^1] + [R/(1+i)^2] + [R/(1+i)^3] \\
 &\quad + \cdots + [R/(1+i)^n] \\
 &= [\$10,000/(1+0.10)^1] + [\$10,000/(1+0.10)^2] \\
 &\quad + [\$10,000/(1+0.10)^3] \\
 &\quad + [\$10,000/(1+0.10)^4]
 \end{aligned}$$

$$\begin{aligned}
& + [\$10,000/(1 + 0.10)^5] \\
& = [\$10,000/(1.10)^1] + [\$10,000/(1.10)^2] \\
& \quad + [\$10,000/(1.10)^3] + [\$10,000/(1.10)^4] \\
& \quad + [\$10,000/(1.10)^5] \\
& = [\$10,000/(1.1)] + [\$10,000/(1.21)] \\
& \quad + [\$10,000/(1.331)] + [\$10,000/(1.4641)] \\
& \quad + [\$10,000/(1.61051)] \\
& = [\$9091] + [\$8264] + [\$7513] + [\$6830] \\
& \quad + [\$6209] \\
& = \$37,907
\end{aligned}$$

In this example, receiving \$10,000 at the end of each of the next 5 years at an annually compounded interest rate of 10% is equivalent to \$37,907 today.

Present value interest factors for annuities (PVIFAs) are commonly programmed into spreadsheet functions and financial calculators and reproduced in tables. The PVIFA is the present value of \$1 received for (n) periods at a compound interest rate of (i) percent per period. PVIFA can be computed directly using the following formula:

$$PVIFA_n^i = [1 - 1/(1 + i)^n]/i$$

Example: $R = \$10,000$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
PVIFA_5^{0.10} &= [1 - 1/(1 + 0.10)^5]/0.10 \\
&= [1 - 1/(1.10)^5]/0.10 \\
&= [1 - 1/(1.6105)]/0.10 \\
&= [1 - 0.62093]/0.10 \\
&= [0.37907]/0.10 \\
&= 3.7907 \times \$10,000 = \$37,907
\end{aligned}$$

When the present value, interest rate, and number of periods of an ordinary annuity are known, periodic annuity payment may be determined:

$$R = PV_0 / \{[1 - (1/(1 + i)^n)]/i\}$$

Example: $PV_n = \$37,907$; $i = 10\%$; $n = 5$ years

$$\begin{aligned}
R &= \$37,907 / \{[1 - (1/(1 + 0.10)^5)]/0.10\} \\
&= \$37,907 / \{[1 - (1/(1.10)^5)]/0.10\} \\
&= \$37,907 / \{[1 - (1/(1.6105))]/0.10\} \\
&= \$37,907 / \{[1 - (0.62093)]/0.10\} \\
&= \$37,907 / \{[0.37907]/0.10\} \\
&= \$37,907 / \{0.37907/0.10\} \\
&= \$37,907 / \{3.7907\} \\
&= \$10,000
\end{aligned}$$

In this example, if \$37,907 is deposited today earning 10% interest compounded annually, \$10,000 would be available for withdrawal at the end of each of the next 5 years.

Annuities Due

An annuity due is a constant stream of payments starting immediately. Annuities due are beginning-of-year annuities. The future value of an annuity due is identical to an ordinary annuity except that each payment occurs at the beginning of a period rather than at the end. Because each payment occurs one period earlier, the present value of an ordinary annuity can be computed and then multiplied by $(1 + i)$. Likewise, the present value of an annuity due is identical to an ordinary annuity, except that each payment occurs at the beginning of a period rather than at the end. Because each payment occurs one period earlier, the present value of an ordinary annuity can be computed and then multiplied by $(1 + i)$.

Times Series Analysis

Bruce D. Rogers

Institute of Government, Tennessee State University, Nashville, Tennessee, U.S.A.

INTRODUCTION

Times series analysis enables public administrators and policy analysts to examine values of a variable over equally spaced intervals of time (unemployment figures, monthly or yearly). Using times series analyses, administrators and analysts can discern patterns in the values that then enable them to forecast future values based on historical and existing patterns.

Times series analyses are important in producing the economic forecast indicators reported by government agencies each month. Federal, state, and local budget analysts continuously track revenues and expenditures over time. Planners make infrastructure decisions based upon population shifts over time, and census officials make projections about trends in society and lifestyles using times series analysis. Police and national crime agencies analyze data collected over time to draw conclusions about trends regarding the security of residents and to look at the impact that new anticrime laws may have had. Agricultural governmental planners are concerned with the variability of crop yields and price supports over time. The continuing national debate about the performance of public schools relies on the times series analysis of performance indicators. Indeed, almost every field in public management and policy analysis collect and analyze data using times series analysis.

TIME FRAMES AND STATISTICAL FORECASTING

While public administrators and policy analysts rely on times series analysis to forecast future values, the weakness of statistical forecasting can be related to time frames for forecasting. Confidence in statistical forecasting is dependent upon the time frames for forecasting and the nature of the information being forecast. Short-term forecasts are generally more accurate in policy analysis than are long-term forecasts. Different disciplines permit greater long-range forecasting than others. Economists may accurately forecast ahead for a year. Those forecasts are fine tuned by the scores of economic indicators that are produced in the course of any year. Educators may be able to forecast school physical facility needs for a decade or more after

analyzing new census data (assuming that the numbers of immigrants remains close to the numbers anticipated). Meteorologists can accurately forecast weather successfully for several days, while longer-term forecasts are more subject to change. The science of astronomy permits astronomers to forecast certain events ahead, or back, for thousands of years. Forecasts are, therefore, evaluated by the time frames of the forecasts and the disciplines in which the forecasts are made.

REGULARITY AND HISTORICITY

Critical for times series is the concept of regularity: recording values at regular intervals of time. It is more productive to look at values over regular time intervals than to look at many values taken all at once, if our purpose is to examine values over time. The concept of historicity is also important: What occurred in the past is a predictor for the future. These two concepts are at the core of times series analysis.

Historical patterns can be effective predictors in the absence of major transforming events. Predictions about terrorists and terrorism were stood on their heads by the events of September 11, 2001: the attacks on the World Trade Center in New York City, the Pentagon in Washington, DC, and the airplane crash in Pennsylvania. Prior to that date, profiles of those who committed acts of terror over the previous three decades would have included only a few who were among the more educated, the more affluent, or older than 30. Prior to that date, acts of terror against the United States did not include coordinated, multiple series of acts in several states at one time. Those responsible for guarding against terrorism relied on the historical patterns until that time and concentrated on profiles different than those described above.

Forecasting in certain policy areas is dependent upon the creativity of analysts to envision alternative scenarios not predicted by past data and to creatively look at multiple interpretations of historical patterns. When analysts look at a diversity of scenarios, forecasters may have greater confidence that the forecast will include a range of outcomes. The World Trade Center experience demonstrates that forecasting must rely upon multiple types and methods of data in cases where alternative outcomes are possible.

Another example of forecasting during a change in historical patterns occurred in the 1980s after large numbers of mental health patients were released from inpatient facilities. Prior to that, planning and forecasting for the care of outpatients assumed continued reliance on inpatient facilities. After the new policy was implemented, prior times series data was no longer relevant for forecasting future outpatient needs.

NO ASSUMPTION OF INDEPENDENCE

The independent variable in times series analysis is “time,” measured in units such as: seconds, minutes, hours, days, weeks, months, quarters, or years. Observations of the dependent variable in times series analysis are often a function of the temporal order in which the data were collected. Since values in a later time period may be dependent upon previous values collected (referred to as “autocorrelation” or “serial correlation”), the assumption of “independence” is not applicable in times series analysis. Statistical techniques such as the Box-Jenkins Times Series Analysis help correct for this.^[1]

COMPONENTS OF TIMES SERIES

Forecasts can be improved if the analyst can understand and identify the patterns in the data. Breaking down the data into its component parts is a technique called decomposition. If you plotted the number of catalog mail orders over the past 10 years by month, there would appear to be an upward linear trend for the entire period. At the same time, there would also be a pattern recurring annually between the Thanksgiving and Christmas season. The seasonal “decomposition” method enables the analyst to break down and to separate the times series analysis to look at trend, seasonal, cyclical, and other variations in the data.^[2]

To assist in understanding past occurrences and to help forecast the future, times series analysis has been assumed to have four component elements: 1) trends; 2) seasonal variations; 3) cyclical patterns; and 4) unexplained reasons. A forecast is made considering each of the four elements separately and then together.

1. Trends over time imply that the data might increase or decrease over time. If one plotted the U.S. population between 1960 and 2000, one would observe that while the trend shows increases, it has not been in a straight line for the entire period.
2. Seasonal variations imply that certain patterns recur at regular intervals. Employment in state tourism industries exhibits regular patterns.

The pattern is what constitutes the seasonal variation in the data. While seasonal may refer to the seasons of the year, it can also refer to the increase in sales of the American flag just before federal holidays or to the variations in applications for state hunting licenses just before deer hunting begins each year.

3. Cyclical patterns occur somewhat irregularly and in durations longer than seasonal variations but shorter than trends. If one analyzes FBI Crime Reports that list incidences of various crimes, certain cyclical patterns may be discerned. During periods of high unemployment, there may be greater incidences of burglaries. During periods of high employment, as in the period 1998–2000, crime indices declined.
4. Times series data that cannot be explained in terms of trends, seasonal variations or cyclical patterns are often referred to as random, the fourth component of times series.^[3]

METHODS OF IDENTIFYING TRENDS IN TIMES SERIES ANALYSIS

There are a number of statistical methods used to identify trends. Three techniques are particularly common:

1. Moving Averages technique takes data from predefined past periods (e.g., every three-year or five-year period) and combines them as a way of forecasting future periods. Each new data point examined thereby becomes an average of past values. This technique gives equal weight to every data point and serves to “smooth” out the data.
2. Box-Jenkins Models referred to as the Autoregressive Integrative Moving Averages technique looks at the past behavior of the data to select a forecasting model, from among several, to be used in the times series analysis. Box-Jenkins provides good short-term forecasts. To be used, though, large amounts of data are required. The models are:
 - Autoregressive models provide forecasts based on a linear examination of past observations.
 - Moving Average models forecast future values based on combining past values and averaging them into new values.
 - Autoregressive–Moving Average models, which are a combination of the first two models, listed above.
3. Exponential Smoothing is a third times series analysis technique. Unlike the moving averages

model that gives equal weight to all observations, greater weight is given in the exponential smoothing model to more recent data observations. This model assumes that the more recent observations are more important in forecasting than are older points.^[3]

These techniques require a degree of statistical sophistication to be utilized.

EXAMPLES OF TIMES SERIES ANALYSIS

There are several types of times series analysis:

1. Describing a trend over time. Have the number of motorcycle highway fatalities declined over time? Have eighth-grade proficiency scores improved over time? Has the rate of growth of state expenditures declined in the last five years?
2. Impact analysis extends times series beyond just description. Through the use of an interrupted times series design, such questions as the following can be addressed: Has the trend in motorcycle deaths declined since a law requiring drivers to use helmets was enacted? Have motorcycle highway deaths declined since medical evacuation helicopter flights were introduced for accidents on state roads? Have eighth-grade proficiency scores improved since the new eighth-grade curriculum was introduced? Did eighth-grade proficiency scores increase after the school board mandated that only those who passed the exam could continue onto high school? Did the rate of growth of state expenditures decline after state voters passed a new proposition limiting state financial mandates for programs at the local level? Did the rate of growth of state expenditures decline after the state legislature reduced state income tax levels? The design is "interrupted" because all of the questions refer to an "intervention," such as the enactment of a new law or rule or regulation. Thus, a new element has been added to the times series, permitting an observer to look at before intervention (baseline) and after intervention times series data. Policy analysts thereby have an additional tool to assess whether a change in policy resulted in a change in behavior.
3. Times series analysis is also concerned with analyzing data by degrees. For example, in states with new helmet usage laws and new laws requiring lower motorcycle speeds on highways, is the decrease in motorcycle highway fatalities greater than in states with only new helmet usage laws? Do eighth-grade proficiency scores increase more in areas where the new eighth-grade curriculum is introduced all at once or where it is phased in? Do scores increase more in areas where both the new curriculum and student promotion requirements are phased in at the same time? Is the decrease in the rate of growth in state expenditures greater in states with strong legislative control over the state budget as compared with states with stronger executive control over the state budget? Regression techniques permit the researcher to answer such questions.
4. Finally, times series analysis is used for forecasting purposes. Based on the data, can we predict how many fewer fatalities might occur if there was another law passed further reducing the speed limits that motorcycles can travel? Can we forecast the results of student performance if even stricter promotion requirements are put into place?

ECONOMIC TIMES SERIES ANALYSIS FOR GOVERNMENT

Government managers and policy analysts are major consumers and users of times series analyses. Examples of available data can be found at Ref.^[4]. The comprehensive times series data library available at the Princeton web site provides an annotated listing of available data sets. Instructions on how to use those data sets are available at the individually listed web sites. The sites include times series of economic indicators, consumer price index data, Bureau of Labor Statistics data, trade surpluses or deficits, stock trading data on multiple exchanges, Organization for Economic Cooperation and Development data, and data for both the United States and foreign nations.

The Economic Report of the President,^[5] contains data covering a 30-year period. For the last 3 years, there are quarterly breakdowns, and for the last 2 years, monthly data is provided for many data sets. Population, government finance, trade, agriculture, and budget data are available. There is an excellent report at the site, with times series tables, about the demographic changes in the United States.

The Economic Time Series Page at Ref.^[6] offers access to wide ranging, frequently requested domestic times series data sets from many government agencies. Data is also broken down by states. This web site permits the user to transform the data from, for example, monthly to quarterly or monthly to annually. Depending on the government data set employed, users can even convert data to percentages. Such manipulations permit the user to transform the data for their own

research purposes. Also at this site, the Bureau of Economic Analysis publishes the Regional Economic Information System, which provides economic data for states, counties, and metropolitan areas for the 25-year period from 1969–1994. Earnings data, employment information, personal income, farm income, and transfer payments are available.

ADDITIONAL GOVERNMENT TIMES SERIES DATA

Using Ref.^[7], permits users to access over 100 U.S. government agencies at one site. Numerous government agencies listed there have reports, which utilize times series data. For example, an analyst in a state department of education may want to compare overall state trends with that of the nation as a whole. By going to Fedstats, the user could click successively on:

- National Center for Education Statistics
- Encyclopedia of ED Stats
- Digest of Educational Statistics 1999
- Preface
- Introduction^[8]

In this example, the user would find, in the introduction to the report times series data on enrollment at the elementary/secondary/higher education levels, times series data on teachers, public perception of education, and student performance in reading, mathematics and science, as well as international comparisons and data on graduates and degrees. For many agencies other than education, there is a similar breadth of times series data available at the site. Fedstats is an excellent resource for students in public administration and policy analysis who need to be informed users and consumers of times series data.

OFFSTATS: Official Statistics on the Web web site,^[9] provides wide-ranging data sets that are organized by country and about 60 topical areas. The country and topical indices offer a rich array of data sets and sources for the United States and for all countries of the world. Students in comparative and international public administration will benefit from a study of the times series resources available at OFFSTATS.

The University of Michigan Document Center's Statistical Resources on the Web,^[10] offers a vast data resource, including times series analysis, for data users who are working in public administration and public policy. Broad topics are divided into more manageable subject areas. If agricultural policy analysts need to see trends in crop yields or government payments to farmers they could go to this site and navigate to find the data that they need. There are data sets for many government function areas.

The Inter-University Consortium for Political and Social Research at the University of Michigan conducts a number of repeated surveys: the General Social Survey, the National Interview Health Survey, the Current Population Survey, and the American National Election Surveys, as well as Consumer Surveys.

GRAPHING TIMES SERIES DATA

Plotting the data is the first step in doing times series analysis. Trend lines can be applied to the graph. Cyclical patterns (seasonal variations if applicable) or any other major changes in the data can be noted.

The following simple times series analyses are taken from the U.S. Department of Education, National Center for Education Statistics, Digest of Education.^[11] The data show that the postsecondary enrollment patterns for men and women both show

Fig. 1 Postsecondary enrollment: Total enrollment in degree-granting 2- and 4-year postsecondary education institutions, with projections, by sex, enrollment status and level: Fall 1970–2009. Source: U.S. Department of Education, NCES. *Digest of Education Statistics 1998* (NCES 1999-036), 1999, and *Projections of Education Statistics to 2009* (NCES 1999-038), 1999.

upward trends between 1970 and 2000, but with a steeper rise for women over the period, and a widening gap in projections for 2009. Indeed in 1980, the gap was practically closed (Fig. 1).

While the gap between full-time and part-time enrollment decreased between 1970 and 1990, the numbers of full-time enrollments outpaced part-time enrollments between 1990 and 2000 and the projections for 2009 show the same wide difference as in 1970. Similarly, the trends in enrollments at two-year institutions showed a narrowing of the gap with four-year institutions between 1970 and 1980, with an increasingly wider difference between 1980 and 1990 and between 1990 and 2000. The projected enrollment in 2009 forecasts as large a difference between the types of institutions as in 1970.

Graphing the data enables managers and researchers to visually assess the patterns in the data, assisting in making decisions about the techniques to be used in the analysis of the data. If the trend line is relatively stable, then simple moving averages or exponential smoothing will be called for. Fluctuating trend lines may require decomposition analysis or Box-Jenkins models.

Trade Policy

Philip A. Mundo

Political Science Department, Drew University, Madison, New Jersey, U.S.A.

INTRODUCTION

U.S. trade policy is both a matter of foreign policy and domestic politics. Mainly because of its constitutional roots in commerce and revenue, trade policy is made largely through the domestic policy process. The dynamics of trade policy making resemble other kinds of major legislation (e.g., budgets) more than foreign policy. Yet trade policy counts in international affairs, and public officials must devise a careful strategy that achieves foreign policy objectives, while accommodating domestic political forces. Although this is usual for other countries, the peculiarities of American domestic politics have serious consequences for U.S. trade policy.

This article outlines the history of U.S. trade policy, its main components, and the political process that produces it. Throughout the article, the reader should pay attention to the delicate balance between foreign policy goals and the messiness of the domestic policy process.

BRIEF HISTORY

Trade policy is as old as the nation. From the beginning, it reflected the basic assumptions in Alexander Hamiltonian's views of the proper role between government and the economy. For Hamilton, an activist government should intervene in the economy to facilitate economic growth. Centralized and focused, the national government was in the best position to do such things as construct infrastructure, provide a centralized and reliable financial system, and promote American commerce abroad.^[1] Toward this end, the national government established high tariffs from the outset for two purposes: initially to raise revenue for the fledgling federal government, and later to protect new American industries from potentially damaging foreign competition.^[2]

American tariffs ebbed and flowed throughout the nineteenth century. Tariffs rose in the first part of the century, fell in the 1830s and early 1840s, then fluctuated until the Civil War.^[3] Beginning in the 1880s, national leaders began to see the value in opening foreign markets to American producers. The fact that American industry had experienced a burst of growth

following the Industrial Revolution made many companies competitive abroad. Threatening to limit access to the American market was one way to gain access to foreign markets; American officials threatened to raise tariffs if a foreign government did not give U.S. manufacturers more access to its market.^[4] Tariffs rose and fell throughout the 1910s and 1920s as public officials responded to various domestic and international pressures. A wave of protectionism dominated the 1920s in tandem with post-World War I isolationism that characterized U.S. foreign policy.^[5,6]

Following the stock market crash of 1929 and the onset of the Great Depression, Congress and the president reacted by passing the Smoot-Hawley tariff. Resulting largely from members of Congress working together to accommodate various organized interests,^[7] the Smoot-Hawley tariff added to national economic problems. As the United States raised tariffs for the purpose of blocking imports and protecting American industries, other nations did the same. The result was a collapse in international trade, which was certainly a contributing factor to the further decline of the U.S. economy, as well as others.

Learning the hard lesson, Congress and the president reversed course 4 years later, enacting the Reciprocal Trade Agreements Act (RTAA) of 1934. The act gave the president more discretion over trade policy, and it reflected the establishment of the liberal economic idea of free trade in the American policy-making machinery.^[4,5] The RTAA set in motion a commitment by U.S. policy makers to freer trade; tariffs would come down in negotiated deals with other nations on the basis of reciprocity.^[2]

Following World War II, the United States reiterated its commitment to free trade by putting its considerable weight behind the establishment of a global international trade organization—the General Agreement on Tariffs and Trade (GATT). After the war, the United States was the major economic, political, and military power in the West. In part because policy makers were committed to the idea of liberal economics on a global scale and because it was in American interests to help the world economy recover, the United States pushed for the creation of the GATT, along with international organizations dealing with finance and aid—the World Bank and the International Monetary Fund.

The original goal was to create a supranational body that would have the authority to adjudicate disputes between member countries. Named the International Trade Organization (ITO), the international body would ensure that the liberal economic idea of free trade became the dominant theme in postwar international business and finance. The goal was not fully realized, however, because nations could not agree to turn over a measure of sovereignty to the supranational ITO. In its place, a compromise emerged that was institutionalized in the GATT. The GATT provided a means for making rules governing international trade, but it did not have the authority to adjudicate disputes between member nations.^[8] Nevertheless, the GATT's activities through the 1990s were the major developments shaping international trade.

1960s Through the 1980s: New Concerns, Greater Complexity

The 1960s and 1970s saw the emergence of new concerns in international trade. Tariffs remained significant as a barrier to trade, but they were reasonably easy to handle. Because tariffs were calculated as a percentage of the price of a good, the task of lowering them involved a relatively simple calculation that could easily be negotiated. The next major barrier to trade was much more difficult to manage. Non-tariff barriers (NTBs) consist of a range of practices that make it more difficult for a foreign producer to operate in a market than domestic producers. NTBs include, for example, domestic regulations over such things as health, environment, safety, and food standards. Lowering NTBs is a more complicated task than simply cutting tariffs, and NTBs themselves are embedded in matters that can be important to a society, quite apart from their effects on trade. In the 1960s and 1970s, GATT negotiations sought partly to address the problem of NTBs, moving ahead only slowly. Nations did not want to sacrifice control over regulating, say, food safety for the sake of expanding the flow of goods and services across national borders.

The picture became even more complicated in the 1980s, as national governments began to wrestle with trade-in services. Services are products that are not based in some physical thing. They include such industries as film making, construction, medicine, legal services, and software. As the importance of these industries became more obvious, national policy makers sought ways to facilitate their flow across national borders. Reducing barriers to trade-in services, mostly in the form of NTBs, proved to be tricky business, and much work remains to be done.^[9] The point here is that the complexity and challenge presented by trade-in services further complicated the task of policy makers.

Add the problem of intellectual property protection to this increasingly messy picture. Producers, largely but not exclusively American, wanted to establish international rules to protect their intellectual property—patents, copyrights, trademarks, software protection, and so on. Intellectual property protection was and is notoriously lax in some nations, and producers found that doing business in these countries was costly. The connection between intellectual property concerns and trade led some governments to pursue the issue through the GATT, resulting in the creation of trade rules governing intellectual property in the Uruguay Round of GATT negotiations.^[10]

Where are we Now?

The World Trade Organization (WTO) replaced the GATT in the 1990s. To some extent fulfilling the promise of its stillborn predecessor, the ITO, the WTO is a supranational body with the authority to adjudicate disputes among member countries. It is also a club many nations want to join. China, for example, sought for years to gain membership to the GATT, and now the WTO, to benefit from the access membership would provide to foreign markets and the promise of foreign investment at home. The WTO has become the target of opponents of globalization. Viewed as an instrument of international capitalism, the WTO is one of the main international agencies, along with the World Bank and the IMF, held responsible for the negative consequences of globalization.

THE MAIN COMPONENTS OF U.S. TRADE POLICY

The United States pursues its interest in international trade through several means: global negotiations, regional pacts, bilateral agreements, and administrative trade relief. Each approach is rooted in the domestic policy process, although in different ways.

Global Negotiations

As stated earlier in the article, the United States has been a major proponent of the global trade regime, first in the form of the GATT, then in the WTO. The domestic politics connected to these efforts were initially fairly straightforward. As the negotiations mostly involved tariff reductions, policy makers had to deal with domestic producers as they sought to secure their interests in the new negotiations. Thus, American agriculture, among the most durable and powerful interests in American politics, has repeatedly protected its interests, still winning subsidies

from the federal government.^[11] As labor unions saw the prospects of key unionized industries (steel, automobiles) in the international economy sink, they switched from a largely protrade stance to opposition to free trade.

As GATT negotiations took on NTBs, services, and intellectual property protection, the domestic politics scene changed. New players in international trade (e.g., environmental groups) jumped into the fray as they saw American environmental regulation potentially being considered as nettlesome NTBs to be negotiated away under the GATT/WTO framework. Add to these issues concerns for labor rights abroad and human rights more generally. American interest groups focused on these issues increasingly came to see free trade initiatives as undermining basic rights. These shifts in the political landscape appeared in sharp relief at the December 1999 WTO meeting in Seattle. Protestors of every stripe took to the streets, impressing delegates to the meeting and national policy makers of the seriousness of their intent and the practical value in paying attention to their concerns.

Regional Trade Agreements

The United States has entered into several multilateral regional trade agreements, the most noteworthy of which is the North American Free Trade Agreement (NAFTA). The three-country pact reduced tariffs between Canada, the United States, and Mexico. As a result of pressure from American unions and environmental groups, NAFTA includes two side agreements, one each for labor and the environment. The purpose of these side agreements is to prevent freer trade among the three nations from leading to labor abuses and accelerated environmental degradation as governments turned away from such activities to increase the competitiveness of their producers.^[12] Whether the side agreements have been successful remains an open question, but the fact that they became a codified part of the formal agreement at all attests to their importance and the growing complexity of international trade agreements.

In addition to the potential for fostering labor and environmental abuses, NAFTA and other regional agreements are controversial with respect to how much they contribute to global free trade. Do trade pacts simply move the locus of protection from national governments to the intergovernmental agency governing the pact? Or, because trade is freer within them, do they lead to the goal of free trade internationally?^[13,14] The economic debate as it relates to NAFTA has become nearly moot in recent years, as the United States' plans for expanding NAFTA in South America have faltered.^[15]

Bilateral Agreements

The United States has entered into numerous bilateral agreements—pacts between two nations typically focused on trade outcomes. These agreements deal with all sorts of industries, from automobiles to semiconductors, and they are usually the result of concerns that American producers may suffer the results of competitive foreign companies. Sector-specific agreements—those dealing with only one industrial sector—are suspect in the eyes of true free traders. They promise certain outcomes—a quota, for example—and aim to control trade. The United States' successive deals with Japan on semiconductors are examples of this kind of agreement. Its proponents argue that the agreements thwarted unfair trade practices on the part of Japanese firms and the Japanese government, whereas detractors say these deals distorted trade and ultimately damaged a major segment of the U.S. semiconductor industry.^[16]

Administrative Trade Relief

This is an enormously complex yet extremely useful tool for U.S. policy makers. Crafted by Congress and the president to provide a means of protection for affected industries, administrative trade relief procedures are essentially bureaucratic and regulatory in nature, and they can be used with precision. Several major forms of administrative trade relief play a significant role in U.S. trade policy. Section 201 is a straightforward provision of U.S. trade law that gives American producers adversely affected by foreign imports protection in the form of higher tariffs. The producers in this case do not have to demonstrate that foreign competitors or their governments have engaged in unfair trade practices. Countervailing duty is used when government agencies determine that a foreign producer has been subsidized by its government, giving it an unfair advantage over American competitors. A duty (or tariff) is levied on the products of the offending company. Antidumping, perhaps the most controversial of these methods, refers to American government efforts to counter a foreign producer's selling of products in the American market at below fair market value. As in the other cases, a tariff is the remedy.^[12]

The United States also uses forms of administrative trade relief to open foreign markets to American products. Section 301 engages when government agencies determine that a foreign government is unfairly blocking the entry into its market of American competitors. The remedy for this action is reciprocal impairment of trade on products produced in the offending country. Section 337 deals with intellectual property protection

in foreign companies, and it is used when an American company's goods or services have been reproduced without appropriate permission. A tariff on selected products coming from that country is the remedy.^[12]

In all these administrative trade relief methods, many decision criteria are based in findings of fact by bureaucratic agencies. Although the president makes the final decision in some cases (e.g., the Section 201 case against steel in 2002), the procedure is nearly automatic once injury and violations have been found. This aspect of administrative trade relief takes the load off the shoulders of elected politicians, especially members of Congress, in the sense that they can maintain a commitment to free trade, while also allowing for protection of key industries, many of which may be part of their constituencies.

THE DOMESTIC POLICY PROCESS AND POLITICS

U.S. trade policy is a product of the domestic policy process and politics. This presents some interesting problems because, in many ways, trade policy is part of the nation's range of foreign policies. It is best to consider this sweeping topic in two pieces: first, the role of the different parts of government in the development of trade policy; and second, the influence exerted by political parties and interest groups in this process.

Government

Congress and the presidency, of course, are principally responsible for the development of U.S. trade policy. Congress's central role is based in its constitutionally prescribed responsibility for commerce and revenue.^[2] Because of its constitutional roots, Congress is inevitably involved in trade policy, prohibited from handing it over entirely to the presidency. The constitutional basis also means that trade policy cannot be treated in the same way as other parts of foreign policy. For example, trade agreements must be approved by both houses of the Congress, not just the Senate, as is the case for other treaties.

Congress deals with trade policy much as it treats other major policy areas. Major trade bills are subject to considerable debate, committee hearings, lobbying, negotiations between the House and Senate, and ultimately, bargaining between Congress and the president. Because economic issues have always been at the heart of trade policy, economic interests represented by their groups fight hard to protect their gains and avoid losses. The arrival of environmental and labor rights issues complicate congressional treatment

of trade policy still further because the topics under consideration are not limited to the competitiveness of American producers and jobs. Dealing with complex environmental and labor rights issues that necessarily have implications for foreign countries makes trade policy an enormous challenge for Congress.

By the end of the nineteenth century, the presidency had become a proponent of free trade.^[17] Representing and accountable to the entire electorate, the president has the leeway to sacrifice the interests of one segment of society to enhance those of the rest of society. The chief executive is also in the position to take the lead with new initiatives that expand free trade. Presidents do not always act as though this is the right calculus; presidents have protected specific industries in response to various forms of political pressure.^[18]

Still, on balance, the president is generally inclined to favor free trade, but must rely on Congress to grant the executive the authority to engage in new initiatives to expand free trade. Congress requires the president to receive trade negotiating authority from the legislature before initiating negotiations. Congress has the constitutional authority to make this requirement because its role in trade policy is constitutionally based. Congress may exact concessions from a president before granting trade negotiating authority in the form of protection for specific industries, for example, or mandating that any new trade deal include provisions to protect the environment. This aspect of congressional–presidential relations with respect to trade policy opens the door for including all sorts of other issues into trade policy and, as a result, complicates the task of trade policy making.^[18]

Presidents since the Carter administration have relied on the Office of the U.S. Trade Representative (USTR) for policy initiatives and to take the lead position among top executive branch agencies in developing trade policies, and shepherding them through Congress and the bureaucracy. The USTR, the head of the agency, serves as the chief negotiator representing the United States in international trade negotiations. Created by Congress to be a toehold for the legislature in the executive branch on trade policy, the USTR now serves the president directly, superceding the authority of other agencies that have interest in trade policy, especially the Department of State.^[19]

Bureaucracy

As explained earlier, bureaucracy plays the major role in administrative trade relief. Government agencies determine the existence and cause of injury to American producers by foreign competitors. These responsibilities play to the strengths of government bureaucracies. They are staffed by experts in a wide range of areas who apply their technical skills to

assigned problems. These tasks also give bureaucrats enormous influence over U.S. trade policy because of their mastery and control of information. Outside experts have certainly challenged the government agencies involved in trade policy, mainly the International Trade Administration of the Department of Commerce (ITA) and the U.S. International Trade Commission. For example, some analysts complain about the methodology used by the ITA in antidumping calculations.^[18] Agencies can also serve as advocates of various trade policy positions and sources of ideas that can be used to modify existing policies. As is true for numerous other issue areas, bureaucrats are unelected policy makers with significant authority over an important set of policies.

Parties and Interest Groups

Political parties and interest groups have played an important role in trade policy development since the nineteenth century. At that time, the Republican party favored protection, while the Democratic party favored free trade. As America's industrial sector became more competitive with foreign producers, the party that represented their interests gradually shifted to a free trade stance. Thus, by the 1960s, the Republican party had become the party of free trade. Meanwhile, the Democratic party switched to the other side, especially as labor unions, among the Democratic party's most important supporters, began to see their interests in protection rather than free trade. Union leaders saw American jobs disappearing as American firms set up manufacturing plants abroad and as imports began to supplant home-grown products in the American market. The United Automobile Workers, for example, traditionally a free trade proponent, switched by the 1980s as foreign competition pushed Detroit to the economic wall. The Democratic party continues to look upon free trade with skepticism, although a centrist part of it, organized under the roof of the Democratic Leadership Council, favors free trade. For the most part, the Republican party supports free trade, although some Republican law makers quickly jump to the protectionist side if an industry in their constituency is threatened by foreign competition.

Interest groups had a great deal to do with the enactment of the Smoot-Hawley tariff. Lobbying legislators for their specific concerns, they pushed through a bill that had something for each special interest but not much for the public interest. Economic interest groups dominated the playing field on trade policy until the 1980s and 1990s. Some American producers saw advantage in opening foreign markets, as others sought protection from rapidly encroaching foreign

competition. Thus, business does not necessarily speak with one voice when it comes to trade policy.^[20] The addition of environmental groups and other non-economic groups to the fray has complicated the trade policy picture. They bring new issues to the table as it increasingly appears to them that trade policy is the cutting edge of globalization. At the start of the twenty-first century, labor unions are almost entirely protectionist, fearing that jobs will go where labor is cheaper and that foreign products will push American firms out of business.

CONCLUSION

U.S. trade policy is a product of the domestic policy process and politics, as well as a part of the United States' overall foreign policy. This arrangement creates some treacherous going for trade policy makers in the United States. They must pay attention to domestic forces and processes as much as they do in any other major domestic policy area, while also finding ways to negotiate credibly with other nations toward the end of expanding free trade. Free trade has won the day as a concept; most politicians pay at least lip service to supporting it, and many policy makers have spent a great deal of time and political capital seeking policies that expand free trade. Yet, there are political hazards. Elections are usually not won or lost on trade policy, but keeping certain interests in one's electoral camp may require using the various mechanisms available to policy makers to protect their interests by protecting their industry.

INTRODUCTION

The demands placed on public organizations keep changing. Public agencies are threatened with budget cuts and reductions in staff, while citizens are requesting increases in the level of services and new services. The federal government is increasingly sharing responsibility with other levels of government, private companies, and non-profit organizations.^[1] Changes in technology are requiring new skills. Technology has taken on much of the workplace's mentally and physically repetitive tasks, so jobs today are requiring employees to assume more challenging responsibilities. For example, the downsizing of many public agencies has left them without the skills they need.

IMPORTANCE OF TRAINING AND DEVELOPMENT

Technology is being used to communicate with many people across large geographic areas, eliminating the need to be nearby for personal interactions. Demographics are changing; for example, there has been an increase in the number of racial and ethnic minorities employed in public agencies. Jobs have become less specialized, forcing employees to work in teams to deliver services, and productivity needs to be improved despite declining personnel and fiscal resources. Changes in goals, the purchase of new equipment, the enactment of new laws or regulations, and fluctuations in the economy are some of the other variables that influence change.

Many public organizations are facing the impending retirement of experienced public servants. By 2006, nearly 31% of the 24 federal agencies that fall under the Chief Financial Officer Act will be eligible to retire.^[2] State and local governments are facing the impending retirements of senior employees as well.

Change has become an inevitable part of organizational life. To remain viable, organizations must learn how to manage change. As the demands placed on public organizations keep changing, organizations must implement training and development activities to ensure that their staffs have the requisite knowledge, skills, abilities, and other characteristics (KSAOC) to confront these new challenges. The comptroller

general of the United States, David Walker, believes that government cannot maximize its resources and accountability without focusing on its most important asset, which is its employees.^[3]

Training can be targeted to help employees learn new job-specific skills, improve their performance, or change their attitudes. Changes need to be anticipated; training and development needs should be identified, planned for, and budgeted. Developing a comprehensive long-range training program requires a strategic human resources management (HRM) plan and recognition that employees are the most valuable resource. Agencies wishing to be viable must develop strategies to maximize their human capabilities. Training and development must be integrated into the core HRM functions.

Training and development have been defined as a planned effort by an organization to facilitate the learning of job-related behavior on the part of its employees.^[4] Training and development programs seek to change the skills, knowledge, and/or attitudes of employees. Programs may be focused on improving an individual's level of self-awareness, increasing an individual's competence in one or more areas of expertise, or increasing an individual's motivation to perform his or her job well. It is important to note the word "planned" in the above definition. Training and development efforts need to be thought out, and the following questions need to be answered:

1. How can you develop a comprehensive training plan to address the needs of managers, elected officials, support staff, direct service providers, and volunteers?
2. What methods can you use to assess your agency's training needs?
3. How can you design and implement the training program?

NEEDS ASSESSMENT

The first step in the training process is to determine the specific training needs. A need can be defined simply as the difference between what is currently being done and what needs to be done. This difference can be determined by conducting a needs assessment of the

skills and knowledge currently required by the position and those anticipated as necessary for the future. A needs assessment is critical to discerning whether performance deficiencies can be eliminated by training. Without a needs assessment, it is possible to design and implement a training program as the solution to a problem that is not related to a training deficiency.

For example, it comes to the attention of higher management that one department's productivity is very low. Higher management attributes the low productivity to a lack of motivation on the part of the employees. Employees are offered performance incentives and sent to training designed to inspire them. Despite the training, productivity is still low. The problem turned out not to be employee motivation but the first-line supervisors unable to plan and delegate assignments and prepare and budget equipment maintenance schedules.

A true needs assessment would have discovered that the problem was different than originally thought and that the solution may involve a different kind of training. In this case, the employees did not lack motivation; rather, it was the supervisors' skills that needed to be improved. Training the supervisors and not the employees would have been more appropriate. It is very important for a needs assessment to be accurate if training is to be successful.

Organizations can determine training needs through a variety of techniques. A strategic job analysis performed prior to the needs assessment is useful. The job analysis should identify the KSAOCs that incumbents need to effectively perform their jobs. Surveys and interviews with incumbents and supervisors; performance evaluations that identify performance deficiencies; criticisms or complaints from clients, staff, or personnel in agencies working with your employees; changes in regulations or operating procedures; and requests for additional training by incumbents can all provide clues to what training is needed.

DEVELOPING TRAINING OBJECTIVES

Training objectives are statements that specify the desired KSAOCs that employees will possess at the end of training. The objectives provide the standard for measuring what has been accomplished and for determining the level of accomplishment. For training objectives to be useful, they should be stated as specifically as possible. For example, learning objectives for software project management would state the following.

Participants in this class will learn to:

1. Identify the best software development methods.
2. Assure proper time is allocated for defining requirements.

3. Schedule realistically and avoid costly delays.
4. Estimate software size and development time frames.

The development of training objectives should be a collaborative process incorporating input from management, supervisors, workers, and trainers to ensure that the objectives are reasonable and realistic.

DEVELOPING THE CURRICULUM

After assessing the training needs and developing objectives, a training curriculum must be developed. Before developing the content and the manner of presenting the information, an analysis of the trainees must first be done. This step is crucial because the trainees often prescribe the kind of training that is likely to be effective. Some of the relevant issues to examine include the following:

- What are the participants' levels of education? For example, classroom instruction may be intimidating for employees with limited formal education.
- What are participants' expectations? Will all participants come to training with the same concerns?
- What are participants' knowledge levels, attitudes, and relationships with one another?
- Are participants prepared to receive technical instruction?
- Is the training voluntary or imposed from above?
- If the training is mandatory, will the participants be threatened by it?

The answers to these questions will provide some guidance to the trainers when developing the curriculum. For example, the Department of Defense uses digital game-based training for its young recruits, who grew up with computers and tend to get bored with traditional classroom instruction.^[5] The curriculum should provide the necessary information and be developed to maximize the imparting of KSAOCs.

One of the first decisions to be made is whether to provide on-the-job instruction or off-the-job classroom instruction or a combination of the two. On-the-job instruction takes place while the employee is actually working at the job site. It is usually provided by supervisors who instruct subordinates in the correct way to perform a task, such as filling out new purchase-order requisitions. Or a representative from the management information systems (MIS) department could demonstrate how to load and set up a new software package. On-the-job training is useful when employees are expected to become proficient in performing certain tasks or using equipment found at their work stations. Because the training is directly related to the

requirements of the job, transferring skills is easier. Employees learn by actually doing the job, and they get immediate feedback as to their proficiency. Other examples of on-the-job training include job rotation, in which employees move from job to job at planned intervals, either within their departments or across the organization. For example, many organizations train managers by placing them in different positions across the agency, so that they are provided with a comprehensive perspective of its operation.

Some KSAOCs are difficult to teach at the work site, so off-site training will be necessary. For example, training probation officers in counseling and listening skills would be difficult to do at their desks because other employees not involved in the training would be distracted by the instruction. Off-site training provides an alternative to on-the-job training. Employees receive training away from their work stations. In addition to avoiding disruptions to the normal routine at the job site, off-site training also permits the use of a greater variety of training techniques. Discussion of some other common training techniques follows.

COMMON TRAINING TECHNIQUES

Lecture

In a lecture format, a trainer presents material to a group of trainees. Lectures have been criticized because the information in them flows in only one direction—from trainer to trainees. The trainees tend to be passive participants. Differences in the trainees' experiences, interests, expertise, and personalities are ignored. Lectures are limited to the transfer of cognitive material. Lectures are beneficial when they are used to introduce new information or provide oral directions for learning tasks that eventually will be developed through other techniques. Lectures are readily adaptable for use with other training techniques.^[4]

Experiential Exercises

Experiential exercises attempt to simulate actual job or work experiences. Learning can be facilitated without the cost and risks of making mistakes while actually on the job. For example, law enforcement agencies use experiential exercises to train officers in emergency and disaster planning.

Role Playing

Role playing gives trainees the opportunity to practice interpersonal and communication skills by applying them to life-like situations. Participants are expected

to act out the roles they would play in responding to specific problems that they may encounter in their jobs. Role playing can be used in a variety of contexts. Law enforcement academies use it when training officers how to interview crime victims, such as sexually abused children or witnesses to a crime. Role playing is frequently used in supervisory training, in which participants are asked to counsel a subordinate who is suspected of having a substance-abuse problem.

Case Studies

The use of case studies in training involves having participants analyze situations, identify problems, and offer solutions. Trainees are presented with a written description of a problem. After reading the case, they diagnose the underlying issues and decide what should be done. Then, as a group, the trainees discuss their interpretations and understanding of the issues and the proposed solutions.

Audiovisual Methods

Videos are often used for training in a variety of contexts. There are videos to educate employees on legal topics such as sexual harassment, hiring disabled applicants, and using progressive discipline; videos that focus on interpersonal and communication skills; and videos that simulate a grievance arbitration hearing, permitting trainees to view the process, hear witnesses testify, see the behavior of management and union representatives, and learn how arbitrators conduct proceedings. Videos can be used to demonstrate particular tasks, such as the procedures to follow when apprehending a suspect or extinguishing a chemical fire. Videos are often used in orientation sessions to present background information on the agency—its history, purpose, and goals. This use eliminates the need for trainers or supervisors to repeat themselves for all new employees and ensures that the same information is always presented.

Trainees may also be videotaped. They may be asked to make a presentation or to provide performance feedback to colleagues. They may then view the videotape to identify their strengths and weaknesses related to the topic.

An advantage of video is that it provides the opportunity to slow down, speed up, or stop the video to review specific activities and enable questions to be asked and answered. A disadvantage to the use of videos is that they can be expensive to purchase or make.

Equipment Simulators

Anybody who has taken a driver's education course probably remembers the driving simulator that

replicated a car's dashboard, and gas and brake pedals. Simulators are used to bring realism to training situations. For many jobs, such as law enforcement, on-the-job training can be too dangerous, such as training police officers when to discharge firearms. So equipment and scenarios that replicate the shadows and noises of alleys are used to train police officers not to over-react. Fire departments use burn buildings, which are designed to withstand repeated fires, to give firefighters opportunities to practice rescue attempts while battling heat and smoke. It would be too expensive or dangerous to burn vacant or decayed buildings. With the use of simulators, new procedures can be attempted without the risk of endangering human lives.

Videoconferencing

Improvements in technology have made videoconferencing less expensive and more accessible to an increasing number of public and non-profit organizations. Two-way video cameras and high-speed networks are able to transport interactive live images across large geographic distances. For example, when training dollars became tight and it could not afford to send individual employees for training, the City of Phoenix contracted for a satellite and videotape service to train employees in its MIS department. New York City's information technology (IT) and personnel departments worked together to establish a video training network, using a channel of the city's subscriber cable system coupled with fiber-optic links, to provide closed-circuit audio and video service to city agencies. A pilot program was designed to teach fire academy drills at 55 department locations.^[6] The advantages of video training include more flexibility in meeting training needs, a reduction in time lost in travel to training sites, and increased uniformity of training.

Community Resources

Public agencies should be aware of the many community resources that are often available to provide training for nominal costs or even for free. Many health-care facilities offer workshops on topics that are targeted to specific issues, such as adolescent or elderly depression, sexual abuse, or substance abuse.

Programmed Instruction and Computer-Based Training

Programmed and computer-based instructions are self-teaching methods designed to enable trainees to learn at their own pace.

The International City/County Management Association (ICMA) provides a variety of professional development resources. It offers self-study courses, training packages, group courses, multimedia training, handbooks, and workbooks. One of its training packages is titled "Measurement for Results: Implementing Performance Measures in Local Government." This training package is designed to help local governments develop a set of performance measures for managing, assessing, and improving local government programs. Students are assigned readings and are then asked to complete written assignments covering the material learned in the lessons, to review questions based on the material, and to carry out a series of activities that apply what they have read.

Computer-based training uses interactive exercises with computers to impart job skills. Training materials are on compact disks. Employees read information, instructions, and diagrams or other graphics on the computer screen and then respond accordingly. The ICMA offers multimedia training in ethics. *Ethos: Multimedia Ethics Training for Local Governments* CD-ROM is available to purchase. Trainees explore and decide how to resolve 21 real-life ethics scenarios in this interactive training program.

Within the last few years, web-based training has become very popular. For many employers and employees, it is convenient and typically less expensive than some other training methods. Sending an employee to a classroom session can be expensive, depending on tuition, travel, hotel, and per diem expenses.

Web-based training can be synchronous or asynchronous. Because the courses can be accessed through a computer with an Internet connection, employees can even receive training at home.

At the federal level, e-learning is facilitated by the Gov Online Learning Center—GoLearn, government-wide resources that support the delivery of the federal workforce through simplified and one-stop access to high-quality e-training products and services. The site acts as a virtual campus and offers free and fee-based courses.

In Washington State, the state Department of Personnel has launched the E-Learning Network (ELN). ELN includes approximately 1200 off-the-shelf courses in IT skills and certification as well as topics such as accounting, sexual harassment and diversity; it serves as a centralized provider for 83 state agencies and more than 70,000 employees.

In Illinois, the state's upward mobility program trains people for positions that the state has trouble filling because of high competition in IT positions from the private sector. It received a 3 yr grant from the Alfred P. Sloan Foundation for the development of asynchronous online curriculum for IT job titles. The state worked with Lincoln Land Community College to put the courses into an online format.^[7]

The American Society for Training and Development found that employees were less likely to take advantage of web-based training if the training is only offered at their desks. There are more distractions there and people are also used to going to a classroom to learn. People like to go to a training center to do the learning even if that learning is online.^[8]

Not everything is appropriate for web-based training. Skills such as how to work effectively as a team member or how to make presentations are better taught in a class where participants have to work together and where employees actually give presentations and receive live feedback. Web-based instruction allows trainers to provide background information and theories, but the skills are best developed through interpersonal interactions. Each technique has advantages and disadvantages, which need to be weighed in relation to time constraints, staff resources, finances, and desired outcomes.

DELIVERING TRAINING

Other issues must be addressed in addition to curriculum. Should the training take place for short periods of time spread over many days, or should it encompass long periods over fewer days? What time of day should the training take place? What size group should be involved? No one right answer exists. It depends on the information being presented or the skills that need to be taught, as well as the aptitudes of the participants and the techniques that are used. Failing to consider any of these factors can negatively influence the results of training efforts. Most public-sector employers cannot afford such waste.

The delivery of the training program is the stage where the trainers and the participants converge. At a well-organized work site, the employees selected for training understand what the objectives of the training are and what they can expect.

It is up to the trainers to create a climate in which individual learning styles are recognized and considered in the delivery of the content. This is especially important for employees who resist training or perceive it as a punishment and not as an opportunity.

Sims suggests that if public-sector trainers understood how individuals learn, they might be able to design programs that enhance learning and that, therefore, are more effective.^[9] Training programs must address not only substantive content or material but also how people learn and, therefore, incorporate different learning strategies.^[10]

As the workforce becomes more diverse, there will be more variation in employees' ability to learn, in their learning styles, in their basic literacy skills, and in their functional life skills. It will be even more

important for training to take into account individual backgrounds and needs. Organizations and trainers will also need to recognize that adult employees learn differently than children. Adult learners see themselves as self-directed and expect to be able to answer part of their questions on the basis of their own experiences.^[11] Instruction tailored to adult learners allows the trainees the opportunity to participate in the process. The role of the training instructors is to facilitate learning; they use lots of questions, guide the trainees, and encourage two-way communication between the instructor and the class, as well as communication among the class's participants.

EVALUATING TRAINING

An evaluation of the training program is necessary to determine whether the training accomplished its objectives. Unfortunately, this is often the most neglected aspect of training, especially in the public sector. Evaluation improves training programs by providing feedback to the trainers, participants, and managers, and it assesses employee skill levels.

Researchers suggest that there are four primary levels at which training programs can be evaluated.^[9,12] The first level is measuring the participants' reactions to the training program. Kirkpatrick refers to this step as a measure of customer satisfaction.^[12] Participants are asked to answer questions such as: Was the trainer knowledgeable? Was the material/information relevant? Will the information they learned assist them in performing their jobs? Data are gathered through the use of surveys distributed at the conclusion of the training session. Asking these questions provides data on the training program's content and the trainer's skill.

Learning has taken place when one or more of the following occurs: Attitudes are changed; knowledge is increased; and skills are improved. The second level of evaluation measures whether learning has occurred as a result of attending the training. Did the participants acquire the skills or knowledge that was embodied in the objectives? Did the training impart the KSAOCs that were deemed important? To determine whether learning took place, participants can be tested on the information presented, follow-up interviews can be conducted, skill demonstrations can be required, or case studies can be developed, which test the competencies that were intended to be taught.^[12] Three to six months after training, the participants can be asked how they would handle situations provided in the case studies if they arose as part of the job.^[13] Supervisors can evaluate the participants on their use of the learned competencies to solve the work-related problems. It is important to note that the methods used should be selected on the basis of the level of mastery desired.

The third level of evaluation attempts to measure the extent to which on-the-job behavioral change has occurred because the participants attended the training program. Evaluation activities are aimed at determining whether the participants have been able to transfer to their jobs the KSAOCs they learned in training. Measurement at this stage is more difficult; it requires supervisors to collect work samples or observe employees' performance. Another technique would be to utilize performance evaluations designed to measure the new competencies.

For change to occur, four conditions are necessary: 1) the employee must have a desire to change; 2) the employee must know what to do and how to do it; 3) the employee must work in the right climate; and 4) the employee must be rewarded for changing. Kirkpatrick notes that a training program can accomplish the first two requirements, but the right climate is dependent on the employee's immediate supervisor. Some supervisors may prevent their employees from doing what was taught in the training program; others may not model the behaviors taught in the training program, which discourages the employees from changing; some supervisors may ignore the fact that employees have attended the training program, and thereby not support employees' efforts to change; others may encourage employees to learn and apply their learning on the job; and finally some supervisors may know what the employees learned in the training and make sure that the learning transfers to the job.^[12]

The fourth condition that the employee must be rewarded for changing can include the feelings of satisfaction, achievement, proficiency, and pride that can occur with change. Extrinsic rewards such as praise from the supervisor, recognition from others, and possible merit rewards or promotions can also result.

The fourth level of evaluation attempts to measure the final results that occurred because employees attended the training. Ideally, training is linked to improved organizational performance. At this level, evaluation is concerned with determining what impact the training has had on the agency. Satisfactory final results can include such things as fewer grievances filed against supervisors, greater employee productivity, a reduction in the number of client complaints, a decrease in workplace accidents, increased dollars raised through fundraising, improved board relations, and less discrimination in the workplace. Some final results will be easier to measure than others. For example, the dollars raised from fundraising activities, the number of workplace accidents, or the number of grievances filed can be easily quantified and compared to times before the training. Other final results, like eliminating discrimination, changing attitudes, and improving leadership and communication are less tangible and more difficult to measure. Such results

will have to be measured in terms of improved morale and attitudes.^[12]

As a final step, organizations must determine whether the benefits of the training outweigh its direct and indirect costs. Examples of direct costs include expenses for instructor fees, facilities, printed materials, and meals. Indirect costs include the salaries of participants who are away from their regular jobs. Has there been a reasonable return on this investment? Basically, was the training worth its costs? Did it accomplish what it was designed to accomplish?

The potential benefits from evaluating training programs include improved accountability and cost effectiveness for training programs, improved program effectiveness (Are programs producing the intended results?), improved efficiency (Are they producing the intended results with a minimum waste of resources?), and information on how to redesign current or future programs.

CAREER DEVELOPMENT

Training has been defined as "the acquisition of knowledge and skills for present tasks, which help individuals contribute to the organization in their current positions. . . . To be successful, training must result in a change in behavior, such as the use of new knowledge and skills on the job."^[13] Career development, however, provides the employee with knowledge and skills that are intended to be used in the future. The purpose of career development is to prepare employees to meet future agency needs, thereby ensuring the organization's survival.^[14]

Career development is used to improve the skill levels of and to provide long-term opportunities for the organization's present workforce. Career development programs provide incumbents with advancement opportunities within the organization, so that they will not have to look elsewhere. Federal managers have found that training opportunities, challenging jobs, and flexible work environments are more successful in attracting workers with IT skills than higher pay.^[15,16] Taking the time and spending resources to develop employees signal to them that they are valued by the agency. As a result, they become motivated and assume responsibility for developing their career paths.

The focus of career development plans is on where the agency is headed and where in the agency incumbents can find future job opportunities. Employees and supervisors should produce a development plan that focuses on employee growth and development. The plan should have measurable development objectives and an action plan. For example, supervisors should review their employees' skills with the job descriptions of higher-level positions within the same

job family or of positions within the organization to which the employee might be able to cross over. By comparing employees' skills with the skill requirements of other positions, the employees and supervisors can determine what experience and training might still be needed for advancement or lateral movement. Supervisors should direct employees to relevant training opportunities and, when possible, delegate additional tasks and responsibilities to employees so that they may develop new competencies.

A number of career development programs can be found in the public sector. Some of them focus on moving employees from clerical or paraprofessional positions into higher-paying administrative jobs. Others focus on developing supervisory and management skills.

MANAGERIAL AND EXECUTIVE DEVELOPMENT

Problem solving and initiative are examples of some of the critical skills managers and executives of public agencies need. Technical experience and competence are no longer enough; public organizations need leaders with the vision to direct and guide their agencies.

To assist in the development of these skills, many state HRM departments and the federal government have developed career development programs, to impart the types of competencies that leaders need to meet the challenges faced in a constantly changing environment. The Michigan Department of Civil Service has identified and provides training on the following competencies: adaptability; aligning performance for success; developing a successful team; building partnerships; building trust; communication and customer focus; decision making; delegating responsibility; facilitating change; innovation; leading through vision and values; planning and organizing work; and strategic planning.

Strategies available to provide training and development opportunities include assigning employees to various jobs; providing on-the job coaching; allowing inexperienced employees to shadow another person around to observe what they do, this can be helpful in learning about a particular area or function; expanding present responsibilities to include a wider variety of assignments and duties; and assigning employees to department or agency taskforces to make them aware of complex issues or issues beyond their usual scope of responsibilities.^[17]

CONCLUSION

Training is typically associated with improving the performance, knowledge, and/or skills of employees in their present positions. Career development is viewed as a continuous process consisting of evaluating

abilities and interests, establishing career goals, and planning developmental activities that relate to the employees' and organization's future needs. Public organizations must recognize the importance of both training and career development planning.

Agencies that are serious about training and career development should continue to monitor, evaluate, and revise their training and career development programs. New approaches to training need to be considered, and organizational reward structures should encourage individual growth and development that benefit both the employee and the organization.

Training for Productivity

Montgomery Van Wart

Department of Public Administration, California State University-San Bernardino,
San Bernardino, California, U.S.A.

INTRODUCTION

There are four challenges for organizations that want to use training and development for greater productivity. First, training and development must be used strategically, which in turn, often means a strategic overhaul of many training systems today. Training systems must be assessed, both for what they can do and what they should do in a robust organization bent on producing both routine operational quality as well as flexibility and innovation in operations and programs. Second, because almost all the reform initiatives being undertaken require more decentralization, empowerment, job expansion, and power sharing, more broadly trained employees are necessary. Technical skills are no less important; however, advanced general skills (e.g., skills formerly largely restricted to supervisors and systems analysts, but now devolved to line workers) generally need greater emphasis. This occurred initially with the wave of total quality management programs in the early and mid-1990s, but has fallen off dramatically. Third, the more strategic use and design of training systems, and a broader training agenda, cannot detract from a strong emphasis on training basics. Organizations and training systems may change over time, but human nature and how people learn does not. Core learning and teaching principles must be constantly reinforced. Untutored trainers, more often than not, are poor trainers. Finally, there must be an emphasis on curriculum and instructional design as training programs and systems are rebuilt. This is particularly true with new stress on self-training, certification systems, higher levels of accountability, and immense changes in technology that are often poorly understood and thus badly used.

With these four challenges in mind, we now turn to a brief review of organizational learning needs, organizational competency clusters and training types, individual learning needs, and individual training needs. In keeping with a productivity orientation, we begin with organizational needs—that is, strategic needs—and move to individual needs, which are covered more briefly.

ORGANIZATIONAL LEARNING NEEDS

As always with strategic planning, the assessment phase is the most important. Without the right questions

and good data, how can good decisions be made? Five questions should be asked with skepticism because ongoing systems frequently “make do” for such a long time that more robust questioning is unaccustomed.

What is the quality of training? This is a technical question and needs a technical analysis.

How appropriate is the training that is being offered? Even more than most systems, training must be constantly updated and upgraded if it is not to be irrelevant and wasteful.

Are the resources and support adequate for the training system? Needless to say, all systems can use more resources in their quest for improvement or excellence, but the chronic underfunding of development activities in the public sector with its heavy personnel-driven workload makes this question pressing.

Is the suitability and substitutability of training properly balanced? For any given problem, training may be the correct, partial, or incorrect response.

Does the training system have the requisite comprehensiveness or complexity for its current stage of development? Answering this question requires a big picture perspective. Are different types of training available both for organizational and individual learning needs (addressed immediately below)?

One way of assessing the training system in a strategic analysis, especially the issue of comprehensiveness, is to look at tiers of learning that may be met in an ascending order of learning needs. The two tiers are basic and advanced learning.

Basic learning occurs primarily by acquiring basic knowledge and skills, and dominates much of the literature and our thinking about training and development. It can be further divided into the routine level and the professional level. New initiates to first-tier learning may be thought of as the young child, the first-year student, the preservice Master's in Public Administration student, the new trainee, or inexperienced user of technology. Still in the basic learning tier but at the high-performing end of the continuum are those at the professional level who are seen, after long periods of hands-on learning and experience, as craftspeople, masters, and operational experts.

We learn by acquiring knowledge and practicing skills throughout our lives. In the world of work, this is especially true of the vast areas of technical material that we must routinely master. Technical material includes the content area in which we specialize—such as law enforcement, social welfare, health, or land management—as well as the processes by which we apply that knowledge—such as laws, regulations, organizational policies, or job requirements. Technical information doubles every 7 yr according to many experts and is clearly increasing at a faster pace. Today, unlike the past in which most basic learning was completed by the end of formal schooling, we must continue to learn throughout our lives if we are not to become obsolete.

The differences between routine training and professional training (also commonly referred to as continuing education) are a matter of sophistication rather than a matter of kind. Experts still acquire knowledge and refine skills, but at a higher level of complexity and intricacy. Public agencies have many programs for mature professionals who are reviewing bodies of knowledge and practice areas for up-to-date information, detailed explication of rules and policies, and cutting-edge solutions to operational issues. Indeed, continual learning needs to take place at this level for a lifetime, without even considering advanced learning. Yet, despite its fundamental importance and the new emphasis on lifelong learning, this is widely bemoaned as an area that is weaker than it should be.

The basic tier of learning, including both the routine and the professional levels, is roughly what Argyris and Schön^[1] called single-loop learning or what Senge^[2] referred to as personal mastery. Without knowledge and skills we cannot be experts, and to give them their due, public bureaucracies generally excel at acquiring expertise.^[3] The next tier, *advanced learning*, goes beyond simple knowledge and skill acquisition to involve learning that expands, creates, and transmits knowledge.^[4] There are many images used in second-tier learning, such as perfecters, improvers, adapters, and innovators, and at a still more high-performing level, artists, inventors, applied researchers, and scientists. The two levels within this tier can be thought of roughly as problem solvers at the simpler level and as systems designers at the more sophisticated level. This tier of learning involves four of Senge's five disciplines for learning organizations, and is what Argyris and Schön referred to as “double-loop” learning. The five types of learning included in this advanced tier are learning by sharing, comparing, systems thinking, competing, and suspending disbelief.^[5]

- *Learning by sharing* is particularly powerful in the affective domain, which is often the gateway to the

other two domains of learning—cognitive and psychomotor. Affective learning is where we learn to believe in and value some things as opposed to others, and therefore is generally a key to motivation. Learning by sharing takes a number of forms, including teaching, discussing, and teaming. Learning by teaching forces people into more advanced modes because it requires teachers to be clear, logical, and organized; to practice themselves and anticipate problems; to respond to questions; to see things through others' eyes; and even, as the old saying goes, to know things backward and forward. Learning by discussing is one of the most important forms of advanced learning because it leads to the discovery of non-routine problems, anomalies, contradictory perspectives, hidden assumptions, and complementary ideas. Learning by teaming was introduced as an antidote to excessive hierarchical tendencies in organizations in the 1980s, and became popular in the 1990s.

- *Learning by comparing* is the basis of the scientific method that compares the past with the present (various types of time series), the “normal” with deviations and anomalies and, in some restricted settings, control groups with experimental groups. From these comparisons come hypotheses about the relationships of phenomena, which subsequently can be proven, disproved, or modified by further systematic observation. Given the tremendous success of the scientific method in modern history, there can be little doubt of its power. Learning by systematic examination of past experience refers to one's own experience, whether that is defined as the person, group, or organization. Learning from systematic observation of others' experience is commonly called benchmarking in the management literature. Learning by experimenting is indeed a robust form of comparison, but it is not always possible. Individuals/organizations perform experiments by changing a practice and measuring the change, such as a change in an intake procedure or technology, with both experimental and control groups.
- Systems thinking is the hallmark of advanced learning for Peter Senge who makes this “discipline” the one that fuses all the other advanced forms of learning “into a coherent body of theory and practice.”^[2] Systems thinking is the antidote to tunnel vision, turfism, stove-piping, and other bureaupathologies that accrue from overspecialization of function and responsibility. Despite the contributions of specialization in the past, contemporary organizational learning finds it more often than not a major inhibitor.
- The ability to learn through competition is captured by expression “necessity is the mother of

invention,” and through the underlying capitalistic belief that competition causes innovation and creativity to flourish in the long run. What Rosabeth Moss Kanter noted for the last decade still holds true, “the question most appropriate for the 1990s is not *what* the competitive world organization should look like but *how* to become one.”^[6] Competition can lead individuals to learn by requiring them to determine what they want to achieve, by driving them toward that achievement or level of excellence, and by creating both incentives for succeeding and disincentives for floundering. Competition itself can be broken down into numerous component parts, including goal setting, striving and risk taking, and learning through failures.

- Of all the modes of advanced learning, none is more commonly discussed, but more difficult to do, than suspension of disbelief. This mode of learning requires the ability to suspend current beliefs about the proper way to do something, the proper way to value, or the nature of truth. We unquestioningly use habits, routines, and belief systems most of the time or we would need to go back to first principles every time. Yet, some of the greatest learning is by seeing the world afresh, discarding (at least temporarily) our mental models, and trying out new ideas, perceptions, and beliefs. Most great scientists and inventors are masters at this type of learning.

ORGANIZATIONAL COMPETENCY CLUSTERS AND TRAINING TYPES

Organizations have various types of functions they must perform that translate into different types of training.^[7] There are three metacompetency clusters: technical training, general skills training, and management training. No strategic analysis of an organization would be complete without an assessment of the strengths and weaknesses of the various types of training, or in some cases, an assessment of the types of training that are altogether absent.

Three types of technical training are identified here: procedural, mechanical, and professional. Procedural training focuses on laws, codes, rules, or procedures that are required for compliance with agency mandates, and for coordination and flow of work. It is sometimes called operations or administrative training. The most common type of procedural training is new employee orientation, which focuses on employee benefits and agency policies. Some of the other common types of procedural training cover topics such as agency overviews, personnel procedures, selection/hiring procedures, and procurement processes.

Mechanical training (also known as mechanical-technical training) focuses on how things operate, how they are built, how they can be fixed when broken, and how they can be maintained. Manual or physical skills are a large part of the training. One of the most common types of mechanical training is training on computers, such as learning word processing programs, graphics packages, spreadsheets, and customized data systems for the organization. Mechanical training is a frequent part of other types of training, and can be quite sophisticated in and of itself (e.g., pilot training).

Professional-technical training focuses on the select knowledge, skills, and abilities needed by practicing professionals in performing their jobs in the public sector. Because professional workers apply principles from mathematics, physical and natural sciences, law, social sciences, administrative science, education, political science, and so on, their training is inherently more theory and principle driven than are most types of training.

Although technical skills focus on the specific knowledge and skills required to perform a specific job, general skills focus on the skills that are needed to perform any or many jobs in organizational life. Most employees come to the organization with adequate basic skills; however, this assumption must be verified, especially for lower-paying front-line positions, some physical jobs, or when a significant number of employees do not have English as a first language. Basic skills include not only the classic “reading, writing, and arithmetic,” but also basic listening and speaking skills and even some basic advanced skills, such as speaking in public and meeting skills. Advanced general skills training focuses on making employees more effective outside their roles as subject-matter specialists. General skills training aims to improve employees’ ability to learn, work with others, adapt, and be productive. General skills training includes courses on learning to learn, interpersonal skills, negotiation, teamwork, problem solving, creativity, goal setting, self-esteem, customer relations, and basic management tools [e.g., flowcharts, PERT charts (performance, evaluation, and review technique), statistical process control, and check sheets].

The last metacluster is management training. Managers at different levels of the organization tend to have different responsibilities and functions and need different competencies,^[8] therefore, this cluster is divided into supervisory, (middle) management, and executive training. Supervisory skills training focuses on supervisors’ direct interaction with subordinates and on getting work done by, with, or through other people. Specific interpersonal skills are one target and so are clearly identifiable personnel processes.

Common topics for supervisory programs are how to evaluate employees, how to conduct selection/hiring interviews, and motivating people.

Management training focuses on complex interpersonal skills (e.g., labor relations) and inter-related group processes (e.g., organizational climate) in an attempt to find organizational solutions within a changing and complicated environment. The focus shifts from individuals to groups and from problems of a unit to the management of programs. There is often a focus on the improvement of general analytical skills (as opposed to the specific analytical skills of technical professionals) and the ability to make balanced judgments based on various data sources. Management training has numerous standard topics, including administrative leadership, workforce planning, labor relations, and project management.

Executive development training is the most conceptual, broadest, and most externally oriented type of training. Programs for executives tend to focus on the role of the organization in the public sector environment, and facilitate the executives' skills in coping with external opportunities and threats and public relations. Typical courses for executive programs focus on media relations, public speaking and contact skills, leadership and organization assessment (generally with databases collected specifically for the training), and strategic planning.

INDIVIDUAL LEARNING NEEDS

Those responsible for designing and implementing learning in the more formal aspects must pay attention to at least three major learning inputs: trainee characteristics, work environment, and learning principles. Trainee characteristics include the knowledge, skills, abilities, and motivation that trainees bring to the training situation. These characteristics are important because they affect the need or lack of need for training, the design of the training, and the outputs of training. Without an assessment of the training needs of the targeted group, it is easy to make false assumptions in designing training. This is nearly as important is the work environment from which trainees come and to which they will return. The work environment affects training in two important ways: 1) through the support that comes from the work environment for training and development activities and 2) through the opportunity given to the trainees to apply new skills and knowledge gained from the training.

In the actual design and implementation of a training program, seven general principles are important to keep in mind to maximize the effect and efficiency of

training. In substantial training programs, the omission of even one of these principles can lead to dismal results in many cases:

- The first principle is the need for *goal setting*, which is an important way to focus and enhance motivation. One level of goals includes those that bring the employees into training. Another level of goals is employed in the training itself, often expressed as desired learning objectives.
- A second need that is important and significantly more central in training settings than in educational settings is *increasing the similarity of training to the work environment*. Three progressive steps increase the similarity of training to the work environment: the use of examples, modeling, and simulation. The use of examples is a cognitive technique that includes simple allusions to applications to full-blown discussions of relevant cases. Modeling is a visual or graphic technique that actually shows the correct behavior to the trainees. Simulations are opportunities for trainees themselves to perform the behaviors.
- The third training principle is *using underlying principles*. Underlying principles emphasize universal or generalizable aspects and enhance transfer of learning from one training situation to another. Therefore, the use of underlying principles is extremely pronounced in educational venues because of the longer durability of the training. However, underlying principles do not, by themselves, teach the specifics that people need to anchor their learning and their more concrete needs. Therefore, it is easy to overemphasize underlying principles to the detriment of the learning endeavor.
- A fourth, surprisingly complex principle, is *increasing the organization of the material*. A brilliant lecture may dazzle listeners, but little may be retained the next day when questions are asked of them, unless the structure of the lecture is readily apparent and reinforced. Neither is organization of the material solely determined by logical structure or cognitive attributes. In fact, one of the most common mistakes is excessive cognitive emphasis at the expense of opportunities to rehearse or question.
- Although *active involvement of learners* in the learning process has been re-emphasized in modern research, it is actually an ancient learning principle. The Socratic method teaches by using questions to discover truths. It requires the learner to constantly question and probe their experiences and understanding. Whether active involvement is stressed as a part of the initial instruction or is stressed separately after instruction, it is basically practice.

- Related to, but separate from, learner involvement is *feedback*. The term feedback refers to the knowledge of results of practice. If there is no instructor-monitored practice, there can be no external feedback. Practice includes exercises (with answers or oversight), tests, discussions, papers, and in-training observation of behavior of behavior in simulation or apprenticeships.
- The final training principle is *using various techniques and stimuli*. By varying techniques, a trainer can engage several of the learners' senses. For example, if something is heard, seen, and written down (the tactile sense), the chances of retention increase greatly. Further, if the learner has the opportunity to verbalize the material, the chances of remembering are at their greatest.

INDIVIDUAL TRAINING NEEDS

Only two issues regarding training methods are reviewed here briefly: some of the basics of good curriculum design, and some of the strengths and weaknesses of instructional families.

Although full-blown lesson plans may not always be required, anyone designing or evaluating any training needs to know the basics of curriculum design. In a training context, curriculum design is how material is organized to maximize learning. There are four simple elements, all of which are critical for effective curriculum design where robust learning is important. First, what are the learning objectives? Second, how will the learning occur (what will the didactic inputs be)? Third, how will the learners practice the information? Finally, what are the performance measures that will be used and to what standard?

Instructional design looks at the specific methods that are used in the didactic input, practice, and performance measurement phases of curriculum design. Different instructional families tend to emphasize different learning principles, so although there is an endless variety of good configurations for good instructional design, there is also an endless variety of bad configurations. Lecture methods include the standard lecture, team teaching, guest speakers, panels, and student presentations. As a family, they are strong at teaching underlying principles and increasing the organization of the material. Discussion methods include question-and-answer techniques, large-group methods, small-group methods, case studies, debates, and individual conferences. Strictly by themselves, they tend to be strongest at setting goals, actively involving learners, and giving feedback. Printed materials include auxiliary reading materials, training manuals, and programmed instruction. Their strengths and

weaknesses tend to mimic those of lecture methods; they are strong in teaching underlying principles and increasing the organization of the material and weak at setting goals, work similarity, involvement, and feedback. Practice and feedback techniques include note taking, adjunct questions, individual exercises, demonstrations, role plays, simulations, survey and self-assessment techniques, tests, and site visits. Their strengths are generally in their similarity to the work environment, involvement, and feedback. Behavior-shaping methods include coaching, apprenticeships, job rotation, self-training and embedded training, and counseling. These methods have as their strengths setting goals, increasing similarity to the work environment, active involvement, and feedback. Technology-based techniques are a category composed of audiotapes, slides, videotapes and films, computer-based instruction, teleconferencing, and various high-end technology uses, such as optical discs. They tend to be strong at teaching underlying principles and increasing the organization of the material, and sometimes in increasing the similarity to the work environment.

CONCLUSION

Training and development for productivity requires a relatively tough-minded approach that begins with an organizational perspective of learning needs and competency clusters and only then moves to individual needs. It requires asking the tough questions about not only what is desirable to achieve from an organizational perspective, but about the standards that are necessary and who will be accountable, including the trainees and trainers.

INTRODUCTION

In the contemporary world, effective democratic governance is anchored, among other key factors, on the degree of openness that governments exhibit in political and administrative affairs and the amplitude of integrity public administrators demonstrate in performing their official routine. Democracy cannot thrive in an environment of secrecy, as the free flow of information is imperative for people to follow and scrutinize the operations of a representative government, assess the policies and decisions it makes, and appraise the conduct of its personnel. Open government, which can promote a culture of probity within the public service, facilitates the consolidation and gradual deepening of democracy.^[1] It strengthens the structures of accountability by applying the wherewithal to reduce malfeasance and corruption in public organizations. The more transparent a government is, the fewer will be the opportunities for public administrators and managers to resort to corrupt practices in the tasks they perform and deeper will be people's capacity to exercise control over arbitrary state power. Framing public policies behind closed doors or adhering to obscure procurement and financial practices can lead to making erroneous choices that may have adverse implications for the community and beyond. The immoderate exercise of bureaucratic discretion in a closed secretive environment or the influence of non-transparent corporate culture and the almost unbound volition of oligopolists to control competition in the market place result in corruption. Thus in the symbiotic relationship between corruption and opacity, discretion and monopoly are critical factors,^[2] and the social and economic fallout of inordinate opacity and pervasive corruption can be a bane for democracy and development.^[3]

THE SOUTHEAST ASIAN SCENE

The financial crisis of the late 1990s was a watershed in political governance in Southeast Asia. It exposed

the imperfections of non-democratic political structures and illiberal regimes and the failure of governments to either protect their economies from internal uncertainties and external threats or expose them to economic instability.^[4] In several countries, it brought to the forefront the inadequacies of the state apparatus in fostering a culture of integrity in both government and the economic market for safeguarding the welfare of the people and in sustaining social and economic development.^[5] The crisis, apart from external factors, also stemmed from the recondite operations of governments and markets and their indisposition to share or disseminate information with/to other stakeholders for the effective transaction of governmental or economic business. It also underscored the relevance of openness to accountability for lessening the opportunities for rent seeking, underhand dealings, and other forms of corruption. It highlighted the need for modernizing government by institutional reforms—making the operations of public institutions more transparent and upgrading the mechanisms for enforcing accountability in governments and financial markets.

Among the Southeast Asian nations, Singapore is perceived to be the least corrupt whereas Malaysia, Thailand, the Philippines, Vietnam, Indonesia and Myanmar are alleged to exhibit levels of corruption ranging from high to very high caused by systemic failures and individual dishonesty.^[6,7] The level of governmental transparency is fairly low as citizen access to information is restricted because of overbearing legal and extralegal impediments.^[8,9] Such low levels of transparency have significantly contributed to high levels of corruption in Southeast Asia.

A variety of social, political, and economic factors have contributed to making corruption pervasive, resulting in the effusion of resources and enervating both development activities and the effective delivery of public service.^[10] Most countries in the region have been under authoritarian or pseudo-democratic rule for prolonged periods, and where democratization has been ushered, the consolidation process has been tardy. In government, accountability structures are

imperfect or weak in ensuring vertical and horizontal systems of checks and balances.^[11] Entrenched elites hardly face any competition, giving them a free will to influence officials to obtain undue advantage to serve their parochial interests. These happen out of the public gaze and often escape social and political oversight.

The economic liberalization programs initiated in the last two decades opened the Asian economies to globalization, spurred corporatization within the public sector, and the privatization of public assets and services. Globalization internationalized corruption as corporate power continues to be raised to high levels in the absence or weakness of civil society, particularly in Indonesia and to a lesser extent in Singapore and Malaysia. Transnational corporations have typically corrupted political and bureaucratic structures for “exploiting market opportunities.”^[12] Asian countries are at risk from such international rackets as money laundering, illegal flight capital, financial crime, and people smuggling.^[13]

The media, which can be a powerful influence in creating a sound public integrity system, has not always been free; rather, authoritarian regimes in most of Southeast Asia placed unjustified restrictions on the press in the past and capriciously regulated the electronic media to serve their parochial political interests. Independent information sources have been few and far between, and only recently have they begun to permeate into society and support openness in governance. In countries such as Myanmar, Cambodia, Malaysia, and even Singapore, excessive press censorship is seen as rebuffs on media freedom.^[14]

Thus from a democratic governance perspective, it became essential to put in place structures and mechanisms that would decelerate rent seeking and both systemic and individual corruption in government and the marketplace, facilitate public access to information to comprehend the rationale for and the impact of government decisions, enforce rules to activate disclosure practices in the corporate sector, moderate mismanagement in public organizations, narrow the hiatus between citizens and public agencies, and improve both horizontal and vertical accountability in government. All these are imperative to boost public confidence and trust in government.

MEASURES TO IMPROVE TRANSPARENCY AND COMBAT CORRUPTION

Under both domestic pressure and external intervention to improve governance, the Southeast Asian governments have embarked on wide-ranging programs to enhance transparency and curb corruption within their fold as well as in commerce and industry.

Some of these initiatives were undertaken even before the financial crises laid bare the structural and procedural deficiencies of governance on both the state and corporate planes, mainly as responses to the demands of international financial institutions. Non-governmental efforts, principally by business and industry groups, were heightened postcrisis to institute high levels of corporate ethics, responsibility, and transparency to raise stakeholder confidence in both national and transnational firms' ability to deliver goods and services.

Government, international, regional, and national organizations have initiated open dialogues and comprehensive analyses to locate black spots in governmental structures that incur diminished transparency and weak accountability and to discern the causes of corruption and other forms of political and administrative malfeasance. The international lending institutions are now adopting a hands-on approach to repair institutional weaknesses and freely collaborating with governments in their quest for sound governance. The World Bank, for instance, has been supporting measures that incorporate “deregulation to reduce opportunities for corruption, enforcement of sanctions through development of special watchdog agencies and robust judicial systems, and through strengthened civil society institutions, such as an independent press to raise public awareness of the corruption problem.”^[11] Surveys and analytic reports on corruption in Thailand, Cambodia, Indonesia, and the Philippines have provided directions to combat the malaise as well as enhance transparency.^[9]

Anticorruption Strategies

Several Southeast Asian countries have endorsed the Asian Development Bank/Organization for Economic Cooperation and Development (ADB/OECD) sponsored Anti-Corruption Initiative for Asia-Pacific. This action plan incorporates “a systematic and readily enforceable approach to fight corruption” to promote “economic and social stability” in the region. Basically, this initiative was to underscore the critical significance of developing accountable and transparent systems in public management, designing effective measures to prevent and investigate all forms of corrupt practices, developing an ethical and trustworthy corporate culture, and promoting active citizen participation in anticorruption exercises by stimulating public discussion of the issue and creating mechanisms for easy access to information. Specific country plans are expected to adopt international instruments and standards to design effective public integrity management systems complemented by legal, structural, and administrative reforms.^[15]

Institutions of horizontal accountability such as constitutionally mandated “oversight” bodies, with varying degrees of operational and fiscal autonomy and, in some instances, with quasi-judicial powers, have been created in several Southeast Asian countries to scrutinize government organizations and investigate corruption and malpractices. For example, the Philippines has a Civil Service Commission to enforce “ethics and accountability” among public servants. The Ombudsman “is mandated to investigate and prosecute the criminal liability of public officials and employees involved in graft and corruption,” whereas the Commission on Audit serves as a fiscal vigilante.^[16] The Presidential Commission for Good Government was entrusted with the objective of recovering ill-gotten wealth from individuals, whereas other measures were put in place to ensure public disclosure of assets held by public officials.^[17] In Thailand, the National Counter-Corruption Commission was granted prosecutorial authority to offset unjust governmental edicts, whereas other similar institutions such as the Constitutional Court, the Ombudsmen, the Election Commission, and the State Audit Commission are responsible to promote transparency and accountability and control corruption in the public sector.^[18] Singapore’s strong state capacity and committed political leadership have been instrumental in building and enforcing the mechanisms necessary to keep corruption at a low level. The government has established several instruments and has been strict in enforcing laws through an independent Corrupt Practices Investigation Bureau. Periodic review of government procedures also has the effect of obviating opportunities for corruption in public organizations.^[19]

Like Singapore, Malaysia has had an anticorruption strategy since the 1960s. However, the Anti-Corruption Agency (ACA), the Public Complaints Bureau, and several departmental committees on integrity, quality, and productivity have struggled in keeping the level of corruption low in the public sector. One limitation of the ACA that catechizes its impartiality and objectivity is its lack of independence from political control.^[20] The effectiveness of this strategy is therefore suspect.

Access to Information

Southeast Asian nations have made slow but steady progress in establishing the structures for the free flow of information between government and society. In several cases, the obstacles in information sharing and dissemination have been gradually removed. Thailand and the Philippines have relatively liberal information regimes, and their constitutions are explicit about people’s right to obtain information for a variety of

purpose—either to check the performance of state officials or to comprehend the basis of policy development. These constitutional provisions have been supplemented by laws and regulations such as the Thai Official Information Act and the Philippine Code of Conduct and Ethical Standards for Public Officials and Employees. This is similar to the East Asian (e.g., South Korea, Hong Kong) experience of information disclosure by public agencies and citizens’ access to governmental information for a variety of purpose and especially to ascertain the outcome of decisions bearing on their lives. While some of these measures appear good on paper, they have not always provided the desired level of access to information nor have they always contributed to enhancing transparency or in curbing malfeasance in government. Both Singapore and Malaysia also fare poorly in disclosing governmental information to the public. Official secret acts and tough regulations on Internet access have restricted information access and disclosure.^[10] Other countries in the region are remiss in creating the appropriate structures for freedom of information and in enhancing transparency in government.

ROLE OF CIVIL SOCIETY AND E-GOVERNANCE

In the fight against corruption or in advocating for greater transparency in government and improving public access to information, civil society institutions have been playing a significant role especially in countries where state initiatives have been ineffective in producing results. Similarly, e-governance initiatives have helped improve transparency and information access. Civil society can partner with non-governmental organizations (NGO) and the business sector in creating a culture of integrity and anticorruption in society by persuading and even compelling governments to institute reforms and creating public awareness of the evil and tackling adverse consequences of corruption. In Thailand, civil society groups and organizations have been active in placing pressure on the government to modify constitutional arrangements and create or strengthen public bodies to combat corruption.^[21] Chapters of Transparency International in some Asian countries have initiated purposive moves against corruption through research and surveys, conferences and seminars, publications, and lobbying. Its annual Corruption Perception Index highlights the extent of corruption prevalent in a country and helps mobilize public opinion and stimulate action for strengthening governmental initiatives. As in Korea, where a bold step was taken by the People’s Solidarity for Participatory Democracy to frame on its own initiative an

anticorruption bill and lobby for its enactment by the national legislature,^[22] the Indonesian Coalition for Information Freedom (a coalition of NGOs) drafted a freedom of information act for enabling greater transparency of government business and parastatal and non-governmental organizations. This was in response to the government's failure to initiate legislation on information access.

The information gap that contributes to the lack of transparency can be substantially reduced by employing information communication technology (ICT) in linking organizational units, the government, the private sector, and the state with the people. Information communication technology can empower the poor and the marginalized in societies by affording relevant information to them and enabling their participation in public affairs through their feedback on public services and the exercise of their "voice." The Internet is being widely used not only to disengage citizens from long queues at service counters and simplify procedures, but also to make administrative practices more transparent and comprehensible. Indeed, e-government links citizens to the state by facilitating communication and enabling a positive relationship between them.

Many Asian governments have afforded ICT high priority and have adopted comprehensive policies to overcome the information divide between the state and citizens. Several governments have gone on-line providing not only a wide array of information on policies and procedure, but also a variety of e-services including easy lodgment of complaints via the Internet and quick retrieval of information.^[23] Dedicated Web portals link citizens to ministries and public agencies and the services they provide. The creation of a "cashless" payment system and processing of clearance documents by using ICT has vastly reduced corruption in the Philippine Customs Bureau and advantaged customers from its services.^[24] Similarly, initiatives in other countries have also yielded useful results.

CONCLUSION

The Asian financial crisis has left its impact on the society and public administration in the region. Apart from causing considerable economic hardship, it also exposed the weaknesses and shortcomings of the existing governmental systems and processes and signified the need for reform to improve governance and public integrity. However, reforms are mainly focused on revamping the institutional mechanisms and strengthening anticorruption legislations without seeking to effect corresponding changes in other areas. In essence, the political systems continue to be largely authoritarian and decision-making processes closed and/or

centralized with limited scope for public participation. In some cases, freedom of expression and information is extremely limited, the media continues to be the captive of the government, independent oversight bodies are absent, civil society groups face formidable constraints, and draconian legislations remain firmly in place. With restricted public scrutiny, public officials discreetly cover up mistakes, are arbitrary in making policy decisions, and indulge in corrupt practices. Because exposure is a powerful deterrent to corrupt practices, Southeast Asian nations need to introduce greater transparency and openness in public management, create independent judiciary and anticorruption bodies with wide power, spare the media from undue restraints, and widen the space for civil society groups to play an effective role. These will benefit society, improve social trust, build public confidence in governments, and contribute to political and economic stability.

Transportation Policy

Jeremy F. Plant

School of Public Affairs, Pennsylvania State University at Harrisburg,
Middletown, Pennsylvania, U.S.A.

INTRODUCTION

Transportation policy is a broad category of public policy, comprising those plans, programs, and actions of all levels of government concerned with the movement of goods and people. Transportation policy goals are numerous and varied. They include the safe and efficient operations of all modes of transportation; the provision of infrastructure, such as highways, ports, airports, and bridges; regulation of private-sector businesses performing transportation functions in society; advancement of science and technology to improve transportation systems; collection of data to measure performance and guide policy formation; measures to secure transportation facilities and operations from the threat of terrorist activity; and the integration of transportation programs with programs in such areas of policy as the natural environment, urban space, parklands, energy usage, and agriculture.

THE FRAGMENTATION OF TRANSPORTATION POLICY

Transportation policy has been characterized in the American setting by a fragmented approach in both its formulation and its implementation.^[1] Despite the creation of a federal department of transportation in 1966, the United States has never had a coherent over-all national transportation policy or plan to guide programming in the various modes and program areas. There are a number of reasons to explain why transportation policy is fragmented. Historically, the nation has relied upon private enterprise to provide most transportation services. The primary role of government has been to regulate the private sector and to provide infrastructure, such as roads, bridges, waterways, port facilities, and airports.

A second factor leading to policy fragmentation has been American federalism. All three levels of government—and, increasingly, a fourth level, regional or metropolitan governance—have traditionally found roles in transportation policy. The most common federal government roles have been as the source of funding for improvements in transportation infrastructure and the regulation of interstate and international

commerce. State and local governments have been the major implementers of policy, actually owning and operating public highways, transit systems, and other transportation facilities. In recent years, stimulated by federal policies and citizen demands for better performance, state and local governments have assumed a major role in planning functions that integrate transportation programs with land-use planning, economic development activities, energy conservation efforts, and a host of other programs that impact transportation or are, in turn, impacted by transportation policies.

Perhaps the most pervasive aspect of fragmentation in transportation policy has been the designing of policies for a specific *mode* of transportation. Modes are important as the basis of most transportation operations. Each has developed in a distinctive historical manner, and each has posed unique problems for policy makers and program managers. The modes of transportation usually considered discrete are water transport, rail, highways, air carriers, transit, and pipelines. Often overlooked is pedestrian travel, which is itself a mode of travel. However, each of the modes contains within it significant variety: railroads include freight and passenger roads, large “Class One” trunk lines, and regional and short lines. Highways carry trucks and automobiles, buses, and taxis. Pipelines may convey liquids or gases. Air policy has to take into account both commercial, scheduled air service, and general aviation (and, increasingly, air freight).

In recent years, *intermodalism* has transformed the transportation sector, raising questions about the traditional mode-based approach to transportation policy. Intermodalism is defined as the use of more than one mode of transportation to perform a transportation service. In the movement of goods, it has become common for freight to be moved in standard containers, often moving from the factory to port by surface transportation, then to a port of entry by air or ship, and then to point of delivery by a combination of rail and trucking. Intermodalism has become a metaphor for the burgeoning of global commerce; it has also been a driving force in changing government policies and priorities. State transportation agencies have been changed from highway departments to multimodal transportation departments, largely to deal with the new realities of the transportation sector.

A HISTORICAL LOOK AT TRANSPORTATION POLICY

Transportation was a policy issue from the beginning of the American republic. This can be explained in two ways. First, the United States in the late eighteenth century was a large and thinly populated nation in desperate need of good transportation. As had been the case for several millennia, the speed of transportation was limited to the speed of sailing ships and the horse. As the population moved inland from the coast and the navigable sections of rivers, the need to conquer distance with better transportation became vital to national development and economic prosperity.

The issue of transportation and other infrastructure improvements divided the early political parties. The Federalist Party under Alexander Hamilton's policy leadership advocated a program of modest national leadership in public investments. It was replaced by the more conservative approach of the Jeffersonians in the early 1800s, although a number of states and some municipalities began to take an active interest in transportation improvements. First canals, later railroads, then, in some instances, transit systems received public *subsidies*. Private companies were given charters or direct assistance to build transportation facilities that, the argument went, would bring benefits not only to the company but the public at large. The Whig Party under the leadership of Henry Clay advocated a national program for internal improvements, many of which were transportation related, but they were unsuccessful in achieving their goals. It was not until the 1860s that a program of aiding railroad companies by awarding them grants of land (a policy supported by President Lincoln, a former Whig) enabled the federal government to achieve its first and still perhaps greatest objective, the opening of the West by supporting construction of a transcontinental railway, which drove the final spike in 1869, giving the nation a system of surface transportation linking every part of the country by rail.^[2]

As transportation companies (principally railroads) matured in the late nineteenth century, a reaction to their power, both economic and political, led to demands for *regulation*. The American preference for the private ownership and operation of transportation services was retained through policies that tried to force private entities to achieve public goals through regulatory restraints. The right of the federal government to regulate interstate commerce pushed the national government into the forefront of transportation policy once again. Beginning with the Interstate Commerce Act of 1887, federal regulatory agencies were set up to do such things as set rates, license carriers, maintain public safety, authorize routes, and other permissible activities of private carriers.

Congress delegated the bulk of the actual policy-making role to the individual regulatory agencies. The structure and operations of these agencies tended to isolate them from policy direction and leadership of the national executive. Lacking a bureaucratic structure of leadership, they were governed by a group of commissioners selected on a bipartisan basis, making it difficult for them to pursue clear policy goals.

Although water-based transportation, both marine and inland, continued to be of major importance throughout the nineteenth and early twentieth centuries, railroads were the dominant mode for both passenger and freight transportation well into the twentieth century.^[3] The Hepburn Act of 1905 empowered the Interstate Commerce Commission (ICC) to set most railroad rates, a major step in providing the public with real control over the railroads. The federal government briefly nationalized the railroads during World War I, but returned them to private ownership shortly after the end of the conflict. The Transportation Act of 1920 recognized that the rail industry was overbuilt and underperforming, and gave the ICC the power to rationalize the national system by creating competitive rail systems within the major regions of the country. However, the ICC was too weak an organization and the railroad industry too apprehensive of public policy direction for the act to lead to major changes. By then, a new modal competition was emerging and with it a changing direction for public transportation policy as well.

FROM RAILROAD TO HIGHWAY TO SKYWAY

The automobile made its first, modest appearance in the years directly before and after the turn of the twentieth century. The automobile transformed transportation policy in a number of ways. Since automobiles were for the most part individually owned and operated, licensing and enforcement of traffic laws increased the role of local and state governments in transportation. The need to improve and expand the primitive road network added another responsibility for government. At first assumed to be a local responsibility, the expansion of the nation's roadways became a national policy goal utilizing a new policy tool, the intergovernmental grant-in-aid, to allow the federal government to support the states financially, while not actually owning or maintaining most of the roadways. This approach was institutionalized in the Federal Highway Act of 1921, which required the states to plan a modern system of roads that would evolve into a national highway system. A series of federal acts since then has helped move the nation toward a degree of uniformity in the design, signage, and maintenance of a national system of highways.

The airplane made its appearance at roughly the same time as the automobile, in the first years of the twentieth century. Commercial use of aviation proceeded swiftly after major technological advances were made during and after World War I. By the 1920s, mail and passengers were being conveyed by fledgling air carriers. The clearly interstate character of air commerce necessitated a federal policy response. The policy approach chosen was regulation, in line with the precedent set by rail policy. The most significant legislation was the Civil Aeronautics Act of 1938, which set up the Civil Aeronautics Authority to regulate routes, license carriers, and set rates.

During the administration of Franklin D. Roosevelt, the regulatory approach was expanded to cover virtually all aspects of transportation in the United States. In addition to aviation, the merchant marine, coastal shipping, trucking, and intercity bus services were all subject to regulation. The private sector, which had initially resisted government regulation, found benefits in the approach.^[4] Regulation protected the private sector from excessive competition and government takeover. As an example, the major transportation services were not nationalized during World War II as the rail industry had been during World War I, even though greater demands were placed upon it in the later conflict.

Regulatory policy helped to stabilize the country's transportation system. Criticism of regulation began to emerge, however, as the decentralized and legalistic approach of regulation was unable to deal with the complexity of transportation's impact on society, or the need to increase economic efficiency to reduce the costs of transportation as a factor in production and personal travel. Nowhere was this more apparent than in the changing transportation needs of cities after World War II.

URBAN TRANSPORTATION POLICY

The growing use of automobiles to commute from home to work began to affect urban areas even before the great movement from city to suburb after World War II.^[5] Trolley companies were the first to feel the impact, with many lines shutting down due to competition from cars, coupled with the economic problems of the Depression years. Urban transportation emerged as a major subset of transportation policy and a major focus of academic interest in transportation.^[6] Urban transportation policy has added greatly to our understanding of the relationship of transportation to other disciplines, including housing, land-use planning, economic development, and architectural design.^[7]

Urban transportation policy has been concerned to a large degree with the impact of the automobile on the

city and alternatives to automobile usage.^[8,9] Experts with an urban policy focus have been at the forefront of arguing for greater expenditures on urban systems, especially ways of providing effective public transit, a major policy issue that has dominated urban transportation planning since the 1940s. Urbanists have also been among the leaders in utilizing sophisticated analytical techniques to measure and model traffic flows, determine citizen attitudes toward transportation, explore the economic impacts of transportation investment, and a host of other important policy questions.^[10]

Urban transportation policy has also been a focal point for consideration of the best type of organizational approach to plan, provide, and manage transportation services. As private bus and rail companies expressed a desire to close due to declining profits or losses, general-purpose governments and regional authorities often stepped in to ensure the continuation of services. This often involved state governments as well. After several decades of little growth in urban rail systems, there has been a renewed interest in alternatives to the highway. Major new systems have been constructed in the San Francisco Bay Area, the Washington, DC metro area, Atlanta, Baltimore, Miami, and Los Angeles. Commuter rail systems also moved from the private to the public sector as private carriers desired to shed money-losing commuter operations.

The assignment of costs is a major policy consideration, before and after construction of the systems. Should the operating costs be covered by ridership fares only, or should government provide subsidies? If so, what is acceptable performance? While not universally recognized as the norm, a 50/50 split between farebox returns and subsidies is a common performance benchmark.

Reversing the trend toward an increased public role is the belief that privatization of public operations leads to greater efficiency or economy.^[11] Privatization efforts have impacted public transportation in areas such as fleet maintenance, policing activities, construction or operation of toll roads, and other support functions. Advocates of privatization have helped expand the policy debate on feasible alternatives to existing transportation programs, the assignment of costs and benefits to groups in society, and means of increasing operational efficiency of transportation operations. Outside the United States, privatization has become a major focus of transportation policy as state-owned transportation organizations have been sold to private interests or have been forced to adhere more to market forces. The privatization phenomenon has profoundly changed transportation systems in both developed nations such as Great Britain and New Zealand and a number of less-developed nations, and promises to

remain an alternative to traditional government-centered programming.

CHANGES IN FEDERAL TRANSPORTATION POLICY

Until the 1990s, most federal legislation dealing with transportation was mode specific. Advocates of a national transportation policy, planned and administered in a comprehensive manner, pushed for the creation of the U.S. Department of Transportation (DOT), which was created in 1966. But the power within DOT remained more with the program agencies organized by modes and programs than with the central office of the secretary. However, the impending completion of the immensely popular and successful Interstate Highway System pulled together a new coalition of groups in the late 1980s to envision transportation policy after the interstate program was terminated. The result was the Intermodal Surface Transportation Efficiency Act of 1991, or as it became known, “ISTEA” (pronounced like the drink). The ISTEA was a major change in federal transportation policy, allowing more flexibility to states and metropolitan planning organizations than had been permitted in prior programs. It also continued funding at a level considered high by most stakeholders. The program increased participation at the metropolitan and state level and became a model for the next surface transportation bill, the Transportation Equity Act for the Twenty-first Century, or “TEA-21.” Influenced more by traditional legislative desires to target money to projects favored by Congress, it retained most of the features of ISTEA. Both ISTEA and TEA-21 helped move state transportation departments along the path away from just a highway construction and maintenance function, and more toward the planning and management of a multimodal, performance-driven system model.

The direction set by ISTEA and TEA-21 was fundamentally retained in the most recent reauthorization of surface transportation programs, dubbed SAFETEA-LU, which passed Congress in 2005. (The official name of the act illustrates the variety of goals now reflected in transportation policy: Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users.) The primary issues involved were issues of quantity more than philosophy: how much total spending would go to transportation, and how it would be divided between programs. A difference between SAFETEA-LU and its predecessors, however, was the growth in the number of congressionally dictated set-asides, suggesting that surface transportation policy is being led as much by congressional interests as from the executive branch.

At roughly the same time that incremental steps toward a more comprehensive approach to surface transportation policy have taken hold at the national and state levels, economic regulation of the different transportation modes has largely been replaced by reliance on market forces. Economic regulatory agencies such as the Civil Aviation Board and ICC were terminated, and many residual regulatory programs, largely related to safety concerns, have been assigned to DOT. The deregulation of transportation industries has had dramatic impacts on the affected industries, leading to a drastic reduction in the number of operating carriers, increasing the diversification of transportation companies, and stimulating the growth of intermodalism and global transportation linkages.

CONTEMPORARY ISSUES IN TRANSPORTATION

As the twenty-first century progresses, a number of educated guesses can be made about the direction of transportation policy.^[12] All signs point to the increasing integration of transportation issues to broader issues of national security, global economic commerce, energy use and conservation, and land-use patterns and planning. One driver of change is technology. Information technology and intelligent transportation systems will add efficiency and a degree of “customer friendliness” to the operations of transportation agencies. More energy-efficient and cleaner vehicles, such as hybrid cars and light trucks, are already creating demand for policies to spur their development and use. Better use of information can also help rationalize demand for urban transportation services and add capacity to a system that is already strained.

Global economic integration will continue, making international protocols on security, information sharing, and uniform regulations on carriers essential. As multicentered urban regions evolve, traditional patterns of suburb-to-city commuting will continue to change, demanding new and innovative approaches to providing the essential transportation service of work-related travel. The aging of the population will raise new issues of service for groups with special needs and for individuals who have passed beyond the age at which they can safely drive.

The threats posed by terrorism and natural disasters have created major changes in transportation policy. The Department of Homeland Security, in particular its Transportation Security Administration, has become a significant new actor in the transportation arena, and is expanding its role from one focused largely on the aviation sector to include more oversight of surface transportation. Port security remains a problem that continues to draw attention from policy makers. Hurricane Katrina exposed the transportation

system to risks beyond terrorist activity. In all, the costs of securing the transportation system from both terrorist and natural threats are staggering, and the need to balance security needs with the needs of efficiency, safety, and conservation have added to the complexity of the transportation policy arena.

In summary, transportation policy in the United States in the postindustrial era is forced to deal with more complex policy issues, as the traditional values of transportation policy, mobility, and efficiency are seen in the context of broader social, economic, and environmental concerns. New approaches for measuring performance and organizing transportation activities have greatly altered the mode-specific, highly regulated system that lasted into the 1970s.

CONCLUSION

Perhaps the greatest policy challenge today remains the imbalance between the critical importance of transportation and the attention it is given in the setting of national political priorities and resources. Transportation accounts for about 16% of the gross domestic product and is arguably the public service most frequently accessed by citizens. Yet it remains a subject that rarely surfaces in national policy debates, and the share of the federal budget devoted to transportation has fallen since 1960, mostly because domestic social programs such as health, social security, and education have grown in importance. The average citizen knows little of the transformation of the transportation sector brought about by globalization, deregulation, and structural change in the transportation industry. The salience of transportation as a policy priority is felt more in state capitals and city halls, as the capacity of the transportation system remains relatively fixed and demand for more and better services increases. However, when terrorism, natural disaster, or cutoffs in oil supplies threaten existing transportation services or lead to significant spikes in costs, we may see the day when transportation policy may once again be

the subject of intense national debate, as it was in the days of Alexander Hamilton, Henry Clay, and Theodore Roosevelt.

ACKNOWLEDGMENTS

I want to thank my colleagues from the Section on Transportation Policy and Administration of the American Society for Public Administration for the many insights I have gained from them over the past decade on transportation policy issues.

Trust in Organizations

David G. Carnevale

Department of Political Science, University of Oklahoma, Norman, Oklahoma, U.S.A.

INTRODUCTION

Trust is “faith and confidence in the intentions and actions of a person or group to be ethical, fair, and non-threatening concerning the rights and interests of others in social exchange relationships.”^[1] Trust is institutionalized in an organization’s rules, roles, and relations.^[2] That means trust is ubiquitous in organizations and nearly everything an organization does influences it, and is disposed by it, in some way.

There is an inherent physics associated with trust. It can be regenerative with a fair measure of openness, a lessening of a need for control, a willingness to take reasonable risks, and amenable to the influence of system members. Regenerative dynamics are self-reinforcing mechanisms that escalate and intensify. They breed trust. Degenerative systems are the polar opposite. Their mutual reinforcing features spiral down to closed-mindedness, self-protective behavior, deepening control, and low trust.^[3] The nature of organizational processes feeds the regenerative or degenerative vitality of an organization. The correlates of the high-trust regenerative model are embedded in everything an organization performs.

For instance, the organizational processes associated with trust are myriad. Trust is associated with productivity,^[4] group performance,^[5] cooperation and conflict,^[6] leadership styles,^[7] managerial assumptions about employees,^[8] need satisfaction,^[9] organizational development,^[10] communication,^[11] psychological contracts,^[12] the quality of labor–management relations,^[13] and “administrative evil.”^[14]

How an organization chooses to structure and, especially, how it elects to manage the work processes above speaks volumes about underlying, often unconscious, assumptions about trust in employees. Organizations are social systems, and trust is a kind of adhesive that holds the social fabric together. Trust is social capital. It is psychological money in the bank. Paradoxically, trust increases the more it is used and disappears entirely if it is not nurtured or is violated.

TRUST

Trust is implicit in whether or not participation and involvement are permitted. Trust is apparent whether

employees have effective voice. Whether or not organizational rewards and incentives are fairly distributed affects trust. The presence of some kind of forum where conflict can be addressed fairly is a correlate of trust. Whether employees are given the chance to do meaningful, not narrowly specialized high-control jobs, demonstrates trust in staff. In all of these design arrangements and social process arrangements, expressions of trust are articulated, sometimes subtly, often symbolically, but always in ways felt by workers. Most staff can easily assess whether the physics of their workplace is regenerative or degenerative when it comes to the sense of overall trust.

Trust is a reciprocal attitude that explains its regenerative or degenerative dynamics. Actions are self-reinforcing. Organizational routines tend to flow in self-heightening or self-depreciating ways. Low-trust arrangements breed low trust. High-trust work conditions are self-reinforcing.

Douglas McGregor^[8] provided the classic description of regenerative and degenerative forces about trust. Managers can assume Theory X attitudes that legitimize low-trust management. These hold that the average human being has an inherent dislike of work, will avoid it if possible, and prefers to be directed, wishes to avoid responsibility, has relatively little ambition, and wants security above all.^[15]

Theory X justifies the command and control bureaucracies so common at the beginning of the twentieth century. If staff members do not want to work, will not work hard without close supervision, and do not have the best interests of the organization at heart, then it follows that employees need to be watched, pushed, and coerced into acceptable performance. It is a prescription for degenerative employee relations.

There is another set of assumptions about people that are the opposite of Theory X. These too arise from McGregor^[16] and are known as Theory Y beliefs. These posit that employees have the capacity to exercise a relatively high degree of imagination, ingenuity, and creativity in the solution of organizational problems. Given this perspective, managers can work with employees to set objectives, reduce oversight, expand the scope of action giving employees greater control over the conception and execution of their work, and invest in staff training and development. Managers can risk that good work can be accomplished without excessive controls. These are regenerative attitudes.

In summary, the heart of trust in organizations emanates from the predispositions managers hold about the nature of people to accept responsibility. The underlying mindsets are pessimistic or optimistic. Because trust is a reciprocal attitude, the core expectations about the motivation and capacity of persons drive management philosophy that, in turn, creates the nature of organizational trust.

HIERARCHY AND WORK ROLES

All organizations are hierarchical to some degree, even those that have labored to flatten hierarchies, “turn bureaucracies on their heads,” create matrix structures, or foster network arrangements. If there is anything that remains true, organizational change agents have not solved the problem of hierarchy and there are implications for trust.

Creed and Miles^[17] described the evolution of organizational designs over time and demonstrated that as organization forms have changed, so have the managerial philosophies concerning trust. The authors compare the Bureaucratic, with the Human Relations model, and, finally, the Human Resources paradigm. Each category represents a managerial philosophy that establishes expectations about the trustworthiness of staff. The Human Resources model is most advanced. It is designated as the “Human Investment Philosophy,” which assumes that people not only want to contribute, but have unlimited potential to learn and grow. People are seen as trustworthy, and the manager’s basic task is to develop human potential. Expectations are high and so is trust. Since the turn of the past century, structure and philosophy have moved from low-trust Bureaucratic, through a transition state Human Relations that served as a counterforce to the classical hierarchical paradigm, to the current Human Resources model, which has more regenerative possibilities.

FAIRNESS

Justice is difficult to define and no doubt varies among people. It is the same with the idea of fairness. Nevertheless, the issue of fairness covers a number of organizational activities that have a profound influence on levels of trust in organizations.

There are many ways to approach the fairness problem. In simplest terms, one can think of fairness in organizations as being about equality and equity in how reward and incentive systems are governed and the extent of justice in how discipline is administered. Mishandling arouses feelings of distrust among

staff. As any manager realizes, workers pay keen attention to whom gets what in organizations.

There are two perspectives on the exchange of rewards in organizations. The first centers on *distributive justice*, which arises from equity theory.^[18] The distribution of outcomes is seen as fair when people get rewards commensurate with what they invest. The more merit achieved, the greater the reward secured. The less the contribution made, the smaller the outcome. Most people understand this calculus as fair. Trust is violated when people who do more receive less and those who do less receive more. It is not an uncommon problem in organizations that misallocating rewards is a catalyst for the downward degenerative sequence.

Procedural justice takes a different tack in explaining how people assess the administration of rewards and punishments in organizations. In both instances, how things are done matter as much (sometimes more) than what is done.^[19] The fairness connection is that if people do not trust the methods used to make decisions, they will not trust results. Like all the other correlates of organizational trust, this is a process issue.

COMMUNICATION

One of the most important process issues in organizations is communication. The questions are whether communication is open or closed, whether people feel free to speak their minds, and whether secrets are entrenched. Openness of communications allows the truth to be understood, for people to be authentic, and for organizations to deal with reality, not some illusion of it. When the free flow of information is manipulated, fear and suspicion are created. Rumors typically flourish, as employees speculate about things they are not permitted to speak openly about.^[20] The former approach is regenerative, high trust. The latter degenerative, closing off possibilities for meaningful levels of trust.

POLITICS

Politics is in play everywhere in organizations. It is about who gets what, when, where, and how. Politics is degenerative when it is characterized by game playing, inauthentic conduct, personalized power motive, and self-interested behavior. It is inevitable that there will be politics in organizations. There is nothing inherently wrong with trying to influence others concerning the allocation of resources, the ends and means an organization ought to pursue. There are honest differences of opinion about the need for and nature of change. It is ethical to form coalitions, keep promises, be civil, refuse to engage in character assassination, tell

the truth, and not promote zero-sum legitimacy. Principled politics are regenerative and promote a culture of trust. Unethical politics breed distrust. Like every other organizational process, there are choices about courses of action. What is embraced has consequences for trust.

LEADERSHIP

It all starts at the top. There are all kinds of leadership styles.^[21] Of all the types, transformational leadership is strongly associated with trust. The transformational leader generates positive feelings in subordinates. The transformational leader possesses: 1) vision; 2) charisma; 3) powerful communication skills; 4) an empowering attitude; and 5) is considered trustworthy.^[22] Transformational leaders are interested in change. They encourage alternative futures. To convince followers to take risks without the guarantee of reward is the key to overcoming resistance to change. Leadership credibility is a powerful source of influence. Without trust, resistance to change and defensive conduct are exacerbated.

CONFLICT

Because people have dissimilar values, mind-sets, objectives, and visions about what an organization should be doing, disagreements are common. Scarce resources encourage endless rounds of positioning for advantage. Contests of will, ambition, and personality clashes contribute to discord. The physics of conflict are also not helpful. Conflict tends to escalate, positions harden, the dispute spreads as partisans seek allies, communication stops, stereotyping occurs, and, finally, revenge becomes an objective. No organization can be high performing if its social system is awash with suspicion and guarded behavior. Like politics, there will be conflict in organizations. Conflict tears at the social fabric of organizations, and trust is one of the first things destroyed.

There is an upside to conflict. It can clear the air. It can get people to express how they really feel about issues. The healthy interaction of differences can lead to synergy in groups, for instance, and then to creativity. When people know they are safe win-lose, zero-sum conduct is reduced. As trust increases, diversity of ideas becomes an advantage.

It is not the law of gravity at work that discord need be dysfunctional. Persons have a choice about what kind of conflict will exist. There are methods available to help public administrators deal with conflict. These are generally known as third-party peacemaking interventions in organizational development or alternative

dispute resolution (ADR) being mandated in several public jurisdictions. People cannot resolve disputes if they do not trust those they think are interfering with the attainment of their legitimate needs, or if they do not trust the process being used to get at differences, or if they have no confidence in the third parties facilitating the process. Trust is always on the table in conflict resolution.^[23]

CONCLUSION

Trust is a function of regenerative practices. It is a precondition for the establishment of harmonious social relations and the elimination of dysfunctional conflict.^[24] Trust matters, because social systems need to have cultures where people can rely on one another under conditions of dependence and risk. Trust is social capital and a moral resource in organizations. When trust declines, organizational capacity is reduced.

Trust is rooted in nearly every structural and process aspect of organizations. Employees are constantly making judgments about trust depending on the general tone of the managerial philosophy that pervades the organization. Workers are sensitive to the cultural aspects of trust. They experience it in work roles, nature of communication, credibility of leadership, the way conflict is handled, the type of politics, and the amount of confidence expressed in them. High-performing organizations feature trust and work to develop it as an important part of the organization climate. Trust is an asset. Its power should not be underestimated.

Truth and Reconciliation Commission

Daryl Balia

*Professional Ethics and Risk Management, Public Service Commission,
Pretoria, South Africa*

INTRODUCTION

To unearth one's bloody and repressive past is highly risky for a country traveling the road of reconciliation and healing. Not only is the prospect of renewed violence kindled, but also the trauma of painful remembrance, which could so easily infect succeeding generations. South Africa as a sovereign nation decided, however, that a collective search for truth and justice was necessary for uncovering its apartheid past. Apartheid, which is Afrikaans for apartness, was institutionalized racial discrimination and segregation, formally enacted into law in South Africa in 1948 and often repressively enforced. The medium chosen was a Truth and Reconciliation Commission (TRC) which was given legal status through an Act of Parliament in 1995. Such a course was not unique, as the examples of postwar Germany, Chile, Argentina, Haiti, and a handful of other countries illustrate. The emphasis in South Africa's case was to legitimize the moral repugnance of all the traces of apartheid, allow for a degree of justice for victims of human rights abuses, offer qualified amnesty to perpetrators upon individual request, and contribute to building national unity and reconciliation. The truncated past was defined from March 1960 to 10 May 1994, despite the fact that the practice and origins of the apartheid ideology go back centuries earlier.

The TRC itself conducted its work from April 1996 to July 1998 through three committees for human rights violations, amnesty, and rehabilitation and reparation, respectively. It was led by former head of the Anglican Church in South Africa and Noble Peace Prize laureate, Archbishop Desmond Tutu, and signed into law by former President Nelson Mandela.

Tutu was of course assisted by 16 other commissioners, regional officers, a research unit, an investigative unit, a legal department, and a media department. As it was given a two-year time frame to complete its operation, the TRC proceeded with haste in conducting mostly investigations and public hearings. It is noteworthy that only about 10% of the 21,000 statements submitted by victims were used for public hearings. Many victims felt cheated as they would come to a hearing only to learn that their story would not be heard. While for some the Truth Commission seemed to offer hope to form a new collective with those

previously disenfranchised (black), for others, it rendered the poor victims voiceless through a process of translation and contextualization. Mostly privileged black males were given time and space to tell their stories at the expense of women who, when given the opportunity, would speak of the sufferings of the voiceless generally. Ultimately, it seems that no redemptive balance was struck about which stories of survival, healing, defiance, torture, killing, or fighting would prevail in defining the TRC outcome.

MODE OF OPERATION

The founding legislation, which was signed by President Mandela on 19 July 1995 and which made the operation of the TRC possible, was the Promotion of National Unity and Reconciliation Act. The broad mandate defined in the act was as follows:

- To establish as complete a picture as possible of the causes, nature, and extent of the gross violations of human rights during the period from 1 March 1960 to the cutoff date.
- To facilitate the granting of amnesty to persons who make full disclosure of all the relevant facts relating to acts associated with a political objective and who comply with the requirements of this act.
- To establish and make known the fate or whereabouts of victims and to restore the human and civil dignity of such victims by granting them an opportunity to relate their own accounts of the violations of which they are the victims and by recommending reparation measures in respect of them.
- To compile a report providing as comprehensive an account as possible of the activities and findings of the commission, which contains recommendations of measures to prevent the future violations of human rights.^[1]

The three TRC committees were specifically tasked with functions that would enable the TRC to fulfill its mandate. The Human Rights Violations Committee conducted hearings throughout the country to give apartheid's victims a platform to tell their stories of oppression. On the other hand, the focus of the Amnesty Committee was on the perpetrators, allowing

them the possibility of seeking pardon for their individual misdemeanors. The Committee on Reparation and Rehabilitation, apart from making recommendations on such matters, also inquired into measures necessary for the prevention of human rights abuses and the creation of a new society free from racial segregation. Some of the work of the Amnesty Committee would later include outstanding matters of the other two committees when the TRC suspended operations.

MODEL OF MANAGEMENT

A country transitioning from authoritarian rule to democracy faces multiple challenges, one of which is how to deal with a repressive past that could potentially destroy its future. Hayner,^[2] an expert on truth commissions, believes that such commissions do have the capacity to give victims space to voice their suffering, promote reconciliation, prevent a repetition of past horrors, and allow for an acknowledgment of transgressions committed. The potential therefore of the TRC process in South Africa, which lasted more than 2 years, as a strategic link in the national management of conflicts needs to be stressed. This is especially in view of the fact that conventional institutions such as the courts, police, political bodies, or defense establishments are not viewed as being neutral enough in a climate of transition. Truth commissions, on the other hand, if they are generally constituted by men and women of honor, are more objectively able to be scribes of history, pursue claims of justice and truth, contribute to personal healing and reconciliation, and institutionalize the emerging culture of human rights than politicians or state bureaucrats. In hindsight, Tutu was convinced that South Africa would serve as an example to the world in matters of conflict management as the verities of hope, peace, and reconciliation had triumphed through the TRC process, despite the evil nature of human beings.^[3]

Less sanguine were some of his fellow commissioners who judged that the quota of truth to emerge from the TRC hearings to have been rather too small. Within the TRC, internal bickering often buttressed by issues of race proved an albatross as a few commissioners failed to complete their terms. Under tight financial constraints, and within a limited time frame, the TRC clearly succeeded in producing a five-volume report of its work that has laid the foundation for the new society to be built as a reconciled community. The role of the TRC leader was pivotal to the entire process, despite a strongly held view by some whites that the TRC would not be impartial and operate with an ideological bent. Members of the (black) ruling elite were equally grieved that the TRC “erroneously” determined that various acts of the liberation struggle

constituted human rights violations. Tutu lamented the absence of a white leader who would come forward and say, “We had an evil system . . . please forgive us.”^a He celebrated the fact that at last, after years of personal struggle, apartheid was unequivocally relegated in history as a crime against humanity. Little wonder then that Nelson Mandela, in his last opening address to parliament, announced that the “doors of the world have opened to South Africa, precisely because of our success in achieving things that humanity as a whole holds dear” (5 February 1999).

IMAGE AND PERFORMANCE

In reliving the memory of the past, the TRC was able at times to offer a theatrical reenactment of pain, as the case of Jeffrey Benzien illustrates. He used to be an investigator in the security branch of the South African police department and was requested by one of his victims to demonstrate the use of the wet blanket method of torture. For many, this was an “archival moment” that would become iconic of the whole TRC process itself. Another involved Desmond Tutu, leader of the TRC, when he broke down in tears after hearing the public testimonies of pain and anguish. Winnie Mandela, former wife of Nelson Mandela, captured the media spotlight by her appearance and confession, under coercion, that “things went horribly wrong” with her Mandela United Football Club that operated more as a vigilante outfit. Thus apart from documents collected, referenced, and preserved by the TRC, there exists the “unofficial” archive of the media images that remain extremely powerful in causing the memory of the past to be made real in the present.

Beyond the image of a legally constituted hearing, which would often lead to a judgment about amnesty, stood the sacred canopy invoking the sounds of solemn assemblies, where confession was elicited, hymns were sung, and prayers were offered often in the presence of Desmond Tutu who dressed in clerical garb as a rule. Performance at these hearings was therefore designed to achieve a cathartic effect, if not to facilitate the public expression of an individual or collective act of forgiveness. The TRC therefore as public performance sought to recreate the past by facilitating testimony that carried the intention of revealing truth and was thus seen as “a theatrical re-presentation of pain suffered and inflicted by victims and perpetrators of apartheid-era violence.”^[5] Not surprisingly, the work of the TRC became the subject of numerous artistic creations, perhaps provoking individuals to explore deep-seated memories in less traumatic

^aSee foreword by Ref.^[4].

ways. Most noteworthy was a literary classic by white poet Krog^[6] whose “Country of my Skull” won international acclaim. Her “fragmentary” style of writing seems to have been necessitated by the fact that here was a white Afrikaner writing with empathy about suffering and pain endured by blacks. Krog dreaded closure in the labyrinth of memory evocations, as the road ahead required the restoration of such memory of humanity itself.

AMNESTY AND RECONCILIATION

One of the foundational principles of the TRC process was that truth telling by perpetrators could be exchanged for amnesty, something at odds with international conventions. Apart from seeing this as “unconstitutional,” many believed that victims were being denied justice, as perpetrators would go free while the material welfare of victims was slowly being addressed. Because the process was slanted toward individual amnesty, there was little hope of the structural evils of apartheid being held accountable. Apartheid, being a crime against humanity, was to go largely unpunished as the TRC had chosen rather to forgive and forget those making contrite confessions. Many commentators would, as a result, accuse the TRC of sacrificing justice at the altar of truth to the detriment of apartheid’s victims. Furthermore, the TRC’s doctrine of reconciliation, while deeply Christian, was controversial. The three prerequisites for reconciliation are truth, justice, and reparation, but these were highly contested notions even among TRC commissioners themselves.

When it was achieved, reconciliation usually proved to be an individual experience during the public hearings rather than an overnight national achievement. The TRC had set in motion, through concrete example, a pattern of life for erstwhile enemies in a rejuvenated moral landscape. Frustration and bitterness might have been the lot for many, but the TRC, despite its “Christian baggage,” provided an important catalyst for the evolution of the new human rights culture. Hence for Tutu, the TRC is “at its heart a deeply theological and ethical initiative. For people of faith, the experience of honesty and mercy, confession and forgiveness, justice and peace, repentance and reconciliation is what truth and reconciliation are all about.”^[7] Prominent Christian leaders, as a result, saw themselves as being lead agents in a renewed ministry of reconciliation, one where the business of forgiveness was to prevail over the cry for vengeance. Of course, the agreements on amnesty and reconciliation were based on political and moral compromise between leading protagonists of the racial divide who both largely shared the same religious faith. The concept of “truth” that was to emerge from the TRC

process was thus qualified and vitiated by an impinging political and, perhaps, an historical thirst for the better future of South Africa.

CONCLUSION

The publication of the TRC final report did not signal the end of the historical transition as some had hoped. Political parties, including the ruling African National Congress (ANC), remain unconvinced about its pronouncements, especially its reluctance to cast moral judgments about their struggles. To have the TRC paint both victim and oppressor with the same brush of justice was an anathema. Considered in the modern paradigm of restorative justice in a transitional democracy, the TRC ranks very high as having set an international standard. In a situation where punishing perpetrators through criminal trials was not desirable, but rather national healing and reconciliation together with building a human rights culture, the TRC stepped forward with limited resources in a very restricted time and answered the call of leading a nation on the “freedom road.”^[8] That its work remains unfinished is also true. The TRC had instructed that all information collected should be held by the National Archives, but by September 2003, this was still undone. Numerous applications for reparations and amnesty are still being processed while the TRC remains officially in “suspension.” As and when these matters reach finality, it may be possible to begin delving deeper into the lasting significance of the TRC for South Africa and the world.

Truthfulness and Lying

Roger Green

Division of Public Affairs, Florida Gulf Coast University, Fort Myers, Florida, U.S.A.

INTRODUCTION

The concepts of truthfulness and lying pose a number of significant concerns for administrators and other public officials. In recent years, the complexity of problems revolving around these concepts has heightened in the wake of demands for greater transparency in government and increasingly stringent reporting and accountability requirements. Traditional principles of representative democracy endorse transparency in government, holding that when public officials are less than fully truthful, they damage a polity's capacity for informed public scrutiny and defy the requirement that public officials be accountable to the sovereign democratic public. However, the dilemmas faced by public officials in a highly competitive pluralist or conflictive international environment oftentimes render the ethics of truthfulness and lying elusive.

Two approaches—one focused on individuals and the paradoxes of the “noble lie” in political life, and the other focused on structural secrecy and deception in complex organizations—play fundamental roles in the analysis of truthfulness and lying in the public sector. Regardless of one's preferred approach, however, it is crucial to note that the forms of deception, as well as their political and ethical implications, are greater in number and variety than is immediately evident in the basic concept of “lying.”

PUBLIC OFFICIALS AND THE “NOBLE LIE”

One of the paradoxes of modern politics is a widespread conviction that on some occasions the exercise of political responsibility (either to ward off public harms or to produce public benefits) may require a public official to engage in deception. An excellent example is provided by New York City Mayor Abraham Beame's decision to withhold information from, and at times to actively mislead, the public as to New York City's looming fiscal disaster during the early 1970s, motivated by a desire to avoid a potentially catastrophic dumping of the short-term city bonds that by that time had become essential to maintaining vital city services and avoiding municipal bankruptcy. Even in such circumstances, questions arise as to whether deception can be accommodated without

damaging the institutions and norms essential to a representative democracy. Moreover, even if a public official uses such methods and by doing so achieves politically praiseworthy results, securing or maintaining the public good, questions are likely to arise as to whether that official nevertheless has been compromised ethically. However ambiguous and difficult such questions might be, they are among the most fundamental ones a democratic public and its officials must wrestle with.

The problems underlying these questions are perennial ones in political philosophy, extending back through the centuries to the works of thinkers such as Plato and Niccolo Machiavelli. Plato, in *The Republic*, endorsed the strategic use of “noble lies” in order to shape the beliefs of people in ways conducive to an effectively regulated class structure and atmosphere of social harmony.^[1] Centuries later in *The Prince*, Machiavelli argued that effective statecraft and political leadership require one to separate the practice of politics from religious values in general and to make strategic use of seemingly unethical practices such as deception. In doing so, Machiavelli was not arguing that “anything goes” in politics, or that a political leader is justified in using whatever methods he pleases to add to his personal wealth and power. Instead, he was pointing toward what he regarded as a fundamental paradox at the heart of politics: that in order to create and maintain the type of stable and secure environment in which citizens can safely live their lives according to religious principles, a conscientious political leader sometimes must be willing to ignore those religious principles. Such a political leader cannot compete successfully against evil without using the weapons of those who are evil, including deception.^[2] In the contemporary political arena, similar justifications are offered on behalf of public officials' use of “noble lies” when faced with the exigencies of a conflictive and relatively disjointed pluralistic domestic arena, as well as when faced with the exigencies of an even more conflictive and near-anarchic international arena.

Philosopher Sissela Bok analyzed the various justifications oftentimes offered by public officials on behalf of such “noble lies.”^[3] These can be summarized as follows:

1. The public has a limited capacity for understanding the “truth” of complex policy issues.

2. The public has a limited capacity for facing the painful realities of politics.
3. Deception is sometimes needed by public officials in order to attain the requisite efficiency, speed, and decisiveness in the face of powerful obstacles or even public inertia.
4. Deception is sometimes warranted *temporarily* as a stage in the education of the public (e.g., “I’ll provide the truth to the public at a later point in time, at which point they will have become sufficiently sensitive to the political realities of the problems I face to appreciate the necessity of my deceptions”).
5. Deception is so pervasive in politics, and there are so many genuinely unscrupulous officials concerned only with self-aggrandizement, that any attempt at “standard-setting” or “line-drawing” is either a useless annoyance or a dangerous competitive disadvantage for a civic-minded public official.

However tempting such justifications might appear, the use of “Machiavellian” or “Platonic” deceptions by public officials is far more complicated ethically in a contemporary representative democracy than it would have been in the context of Machiavelli’s and Plato’s thought. In a representative democracy, citizens are the ultimate source of political authority, and public officials are merely their surrogates. Yet a Machiavellian or Platonic strategy of *principled* deceit would require that public officials sometimes be willing to deceive the sovereign public or their delegates if they felt that doing so could advance long-term public goals. This poses a serious paradox: how can the surrogates ethically justify deceiving the individuals—the public or the public’s delegates—in whose hands political authority rests? Owing to the seriousness of this problem, a strong *prima facie* position must be taken against public officials’ use of deception, and the burden of proof should rest on the shoulders of the public official who thinks it necessary to violate this general principle in a particular instance.

Propaganda

Deception on the basis provided by the “noble lie” or by Machiavellian prescription is far more variegated than might be evident in the concept of lying *per se*, displaying a number of key typological distinctions. One such type is that represented by the deceptive strategy of propaganda: one-sidedly highlighting or providing only those facts that are favorable to one’s policy preferences or administrative positions. Propaganda oftentimes proves an attractive strategy of deception: if a more “truthful” perspective on, or set

of facts relating to, an issue is discovered by potential critics or policy opponents despite efforts to frame the issue in an overtly one-sided way, public officials can proclaim that they did not lie or try to hide anything, but instead offered what was regarded as the appropriate interpretation.^[4] Despite its attractiveness as a strategy, however, propaganda carries with it some risks. In the long run, purveyors of propaganda all too easily become captives of their own propaganda, being forced to continue disseminating the same propaganda in the future (in order to maintain consistency and “face”), or else literally losing their ability to distinguish between truth and propaganda. Both of these maladies, for example, have been diagnosed by critics in assessments of the role played by official disinformation during America’s escalating and ultimately tragic involvement in Vietnam.

Secrecy

A second key type of deception is that of secrecy, or the withholding or active concealment of information. Secrecy also possesses attractive qualities compared to outright lying. A public official’s credibility is less at risk in the event of discovery than would be the case if outright lying had been used. Secrecy can be portrayed equivocally as an absence of candor, rather than stand out as an act of dishonesty and straightforward violation of a public official’s obligations to the public. In addition, secrecy allows a greater range of strategic variations and nuances than does lying. For example, while maintaining secrets, a public official might release selected information from time to time for various strategic purposes. Also, while maintaining secrets, a public official may offer selective access to otherwise hidden information as a way of co-opting potential dissidents or critics, requiring as a *quid pro quo* that they walk away from even more sensitive information the public official is unwilling to disclose.^[4]

However, a public official’s desire for secrecy oftentimes is rooted in genuine political imperatives. First, full and immediate transparency or publicity sometimes can damage policy making, and hence, the public good. Effective policy making (especially when dealing with controversial policy problems) often requires a tentative process of learning about, testing, and weighing controversial alternatives in private before publicizing the chosen policy. Conversely, full and immediate publicity might lead policy makers to avoid consideration of controversial alternatives and to merely “play it safe” or even to pander to the public. Second, secrecy is sometimes necessary to protect the innocent or vulnerable or to respect the privacy of citizens. And third, the threat of full and immediate transparency in many cases might lead administrators and

policy makers to avoid putting things in writing that really should be put in writing. Many public officials may begin to write an e-mail or memorandum on a politically or institutionally sensitive topic, only to reconsider at the last moment and opt instead for a telephone call or conversation behind closed doors. Although the fleeting character and impermanence of a telephone call or face-to-face conversation is acceptable in many cases, in other cases, the points covered and the agreements made during the conversation may have warranted permanent documentation. Still, all of these considerations notwithstanding, in a representative democracy, most commentators insist that public officials should respect the *prima facie* case against secrecy and in favor of transparency, while trying to identify special cases where secrecy may be ethically justifiable.^[5]

Lying

Lying, a third key type of deception, obviously carries substantial risk for the public official who uses it. If found out after such a wrongful *commission*, it is significantly more difficult for the official to find a credible hiding place than it is after the ethically questionable omission represented by propaganda or secrecy. Moreover, because lying is the most extreme form of disinformation, it clearly requires the most stringent ethical limitations on its use. Despite all of this, lying can be tempting to public officials, in part because lies can be so attractive to listeners. Because a liar may have a good idea as to what listeners would like to believe, whatever lies the listeners will be readily susceptible to can be strategically offered. Augment these temptations with the cross-cutting ethical ambiguities of “noble lies” and the oftentimes compelling arguments that can be offered on their behalf, and one is left with a situation in which public officials may be tempted to avail themselves of such lies with scant critical reflection.

In spite of the dim view she takes in general toward deception by public officials, Sissela Bok—whose catalog of common justifications for deception was summarized near the beginning of this article—is willing to accommodate deception by public officials under limited circumstances. For example, she argued that public officials should enjoy greater latitude when it comes to information about their private lives, but that secrecy or a mere withholding of information in such cases—at the very least, a terse “no comment”—is the most appropriate response, not outright lying. She also argues that temporary disinformation may be ethically warranted when the “truth” at a particular stage clearly might be damaging to the public good—for example, in the face of an upcoming interest-rate

decision by the Federal Reserve Board, premature notice of which could lend itself to currency and bond market manipulations (here again, however, it is instructive that Bok favors “secrecy” over “lying”). And finally, Bok accepts the deceit inherent in certain types of necessarily covert activities, such as undercover police “stings.” Nonetheless, she agrees powerfully with the idea that there should be a *prima facie* injunction against deception by public officials, as well as that idea that the burden of proof should be borne by any public official contemplating deception. In doing so, she insists on the following general standard: “only those deceptive practices which can be openly debated and consented to in advance are *justifiable* in a democracy.”^[3] In other words, the possible exceptions cited earlier in this paragraph are justifiable precisely because the public can openly discuss and consent to these within appropriate limits.

Such a strong *prima facie* injunction is warranted for several reasons. First, public officials contemplating “noble lies” can easily confuse “bad” motives and “good” motives when judging themselves, especially in cases where an initially justifiable deception gets followed by unjustifiable lies in order to cover up the original act of deception (this same problem can readily afflict propagandists and advocates of strict secrecy, rather than being unique to liars). Second, public officials often suffer from a tendency to overrate their own ability to make rational choices while underrating the comprehension of average citizens. Third and perhaps most important to critics such as Bok,^[3] Arthur Applbaum,^[6] and John Burke,^[7] however, is the possibility that public officials’ acts of political deception will have damaging cumulative effects, to such a degree that it is inadequate for public officials contemplating deception to evaluate their cases strictly on an individual basis. Each act of deceit, through the power of prior example and the competitive pressures it generates in a pluralistic environment, contributes to the increasing ease with which other officials will come to use deception, even in far less justifiable instances. Ultimately, this can have a long-term corrosive effect on the public’s trust in government.

Destruction of Information

Whatever one’s stance toward these initial three types of political deception and “noble lies,” the type of political deception most difficult to exonerate is a fourth one represented by the destruction of information, i.e., falsifying or destroying pertinent government documents and records. Doing so eliminates any possibility of a retrospective assessment of one’s actions by others, which is necessary to determine whether the conditions cited as justification for the

deception were, in fact, sufficiently compelling. By extension, this would also undermine the evaluation and enforcement of retrospective accountability, needed as a bare minimum for ensuring that democratic principles have not been ignored. In the absence of such a process, one could merely destroy the documents needed by others to assess the legitimacy of one's allegedly "principled" deceptions, insist to others that one's reasons were legitimate ones, and arguably short-circuit any further process of ethical judgment. If a public official truly believes that a situation is so serious as to warrant the deception of other public officials and the public, then that official should be willing to submit to a subsequent review of this deception. This subsequent review cannot be carried out effectively if the relevant documentation has been destroyed or falsified beyond repair, and it cannot be carried out if a public official in general fails to respect the right and ability of others to gather and present relevant information that is contradictory to his or her objectives. This imperative—analyzed tellingly by Dennis Thompson under the rubric of "retrospection,"^[8] and by Donald Warwick under that of "veracity,"^[9]—is perhaps the key one invalidating the "noble lie" justification offered by Oliver ("Ollie") North in the aftermath of the so-called "Iran-Contra" scandal, when he "shredded" or otherwise destroyed a substantial amount of documentary evidence once word was received that an investigation was underway.

SYSTEMATIC DECEPTION, STRUCTURAL SECRECY, AND BUREAUCRACY

The analysis thus far has focused on the political exigencies and ethical implications of *individual* acts of deception, which conforms to the approach most commonly found in deliberations on truthfulness and lying in public life. In contemplating such issues, most observers tend to adopt an approach centered on individuals, one that focuses on a desire to identify wrongdoers and to apportion blame among the various individuals implicated in an ethical transgression. As carried out in many cases, this approach appears to be premised on a vision of administrators and other public officials as rational, calculating, and largely prescient actors able to consciously weigh the choices before them. However, focusing attention on individuals without understanding the organizational environment in which the dilemmas of truthfulness and lying manifest themselves can blind one to the significant influences constituted by an organization's structure, culture, and external political environment. In particular, inattention to these broader environmental factors can obstruct an understanding of the *systematic deception* and *structural secrecy* contributing to incidents such as the Space Shuttle

Challenger disaster. An organization's structure, culture, and external political environment can lead to a systematic distortion or occlusion of important information in ways largely resistant to any individual's control, sometimes to such a degree as to generate organizational pathologies.

Organizations, Resource Scarcity, and Systematic Deception

According to writers who approach issues of truthfulness and lying through this second perspective, organizations should be viewed as networks of "fealty" and "patronage" between superiors and subordinates,^[10] and as arenas of horizontal competition between units or subdivisions striving to preserve or increase their resources in an environment of endemic resource scarcity.^[11] Such conditions can create powerful incentives—and often even unconscious pressures—to present strategically distorted information upward and outward, in order to create the image of one's organizational unit safest for protecting resources and for deflecting blame should problems arise.^[12] This is especially true of mid-level managers whose intermediate location within the organizational hierarchy, in combination with their aspirations to move upward, imposes an unusual mix of burdens and uncertainties.

In some cases, this problem may manifest in a pronounced emphasis on the dexterous but potentially misleading use of tentative, vague, or heavily euphemistic language in order to obscure discomfiting facts, preserve personal maneuverability, defuse criticism, and avoid being viewed as a bearer of bad news.^[10] In organizations with units that are segmented horizontally and vertically into divergent pockets of specialized expertise, this linguistic phenomenon may be reinforced through a reliance on technical references and terminology within reports that are resistant to complete understanding by anyone outside the group, as well as through a tendency for personnel occupying strikingly different roles within the organization to largely talk past one another and to project strikingly different "truths" on the same underlying body of data (in the Space Shuttle Challenger case, the often stark divide between "engineering" and "management" was most notable).^[11]

Structural Secrecy

In other cases, such problems may manifest in the form of upward or outward communications from which significant but potentially disquieting facts have been winnowed in the process of summarizing a diverse body of information. Ironically, recent trends toward more stringent reporting standards may inadvertently

exacerbate rather than ameliorate this problem. Frequent and standardized reporting all but require that information be condensed and generalized in a manner that lends to such winnowing. It may also eventuate in “information hoarding” by units that feel trapped in a competitive struggle within a capricious organizational and political environment, and that regard such tightly held information as a valuable hedge against future difficulties. The secrecy embedded in these phenomena is anchored in the structure, procedures, and protocol of bureaucratic organizations.^[11]

CONCLUSION

In such an organizational environment, even individuals keenly aware of the problems likely to result from systematic deception and structural secrecy may find it difficult to avoid putting on the “team face” and basing their judgments on situational rules of thumb, rather than face the potential dangers inherent in adopting a strong and consistent commitment to truth. Wearing the face of an unwaveringly ethical person risks alienating team members, because such ethical “rigidity” may be viewed as imposing limits on other team members’ maneuverability in the event of trouble.^[10] When contemplated through this organizational perspective, reducing the likelihood of deception in an organization depends far less on whether one scrutinizes and apports blame to specific individuals, and far more on whether one carefully dissects the organization’s underlying structure and reshapes it in ways less hostile to healthy information flows and to individual ethical reflection.

Tuskegee Study

Holona L. Ochs

Department of Political Science, University of Kansas, Lawrence, Kansas, U.S.A.

Andrew B. Whitford

Public Administration and Policy, University of Georgia, Athens, Georgia, U.S.A.

INTRODUCTION

The Tuskegee Syphilis Study, which was conducted by the U.S. Public Health Service (PHS) through the Tuskegee Institute between 1932 and 1972, sought to examine the “effects of untreated syphilis on the [N]egro male.”^[1] The study began with at least one good purpose: to consider ways to improve the health of African–American males in the south. It ended with the broad recognition that its means violated the individual rights of study participants, that researchers in the study had been failed by their individual integrity, and that the organization conducting the study did not contain sufficient checks on professional practice to restrict unethical action (described below). Perhaps more importantly, it ended with the recognition that many professionals and decision makers throughout society who knew of this study did not take appropriate protective action (an official history of this study is located at: <http://www.cdc.gov/nchstp/od/tuskegee/>). This history, along with changes to federal regulations for research projects involving human subjects, document another lasting effect of the Tuskegee Syphilis Study: it changed federal research establishment, especially organizations such as the PHS and the Centers for Disease Control (CDC).

The Julius Rosenwald Fund, which was established in 1928 to promote the health, education, and welfare of African–Americans, provided many of the initial charitable contributions that funded research and treatment for African–American syphilitic subjects in the south.^[2] By 1931, the Depression had nearly depleted the Rosenwald fund, and attempts at actual treatment of patients ended. Following this, the PHS decided to use a group of 600 low-income African–American men in Macon County, AL, 399 of whom had syphilis, to determine if syphilis differently affected African–Americans. This began the longest, continued, non-therapeutic medical experiments on human subjects in history.^[3]

The policy significance of the Tuskegee study is the fact that the publicity it generated strongly contributed to the development of systematic standards for evaluating research programs involving human subjects. The administrative significance is that, using government authority, officials undertook unethical behavior

and implemented unethical policy. The long-term effect of this experiment has been to undermine trust among American minorities in both government and medicine. Of course, because this study was carried out using African–American doctors, nurses, and institutions, repairing this damage is even more complicated. The Tuskegee study remains a potent symbol of the government’s abuse of African–Americans in the United States, racism in science, arrogance of the medical community, and misconduct in research involving human participants.

A BRIEF HISTORY OF HUMAN SUBJECTS RESEARCH

Historically, non-consensual experiments have been regularly performed on captive populations in an institution, particularly when groups of people are seen as “less than human.” Examples of unethical research similar to the Tuskegee study include the following:^[4]

- Experiments conducted by Nazi physicians during World War II (WWII)
- Experimentation in 1952 on Harold Blauer at the New York State Psychiatric Institute in conjunction with the U.S. Army Chemical Corps
- An experiment conducted in 1953 on a premature infant at the Brooklyn Doctors Hospital without any attempt to obtain informed consent
- The Jewish Chronic Disease Hospital case of 1963 in which 22 chronically ill non-cancer patients were injected with cancer cells
- The injection of hepatitis in severely retarded children at the Willowbrook State Hospital in New York
- The Cincinnati radiation experiments on an entirely non-consensual group of cancer patients of below-average intelligence who were primarily African–American, resulting in acute radiation sickness, severe burns, and premature death
- The study conducted at the Veteran’s Administration West Los Angeles Medical Center, which was shut down in 1999 for experimenting both on subjects who had not consented and those who expressly refused consent.

The recurring theme is that latent tendencies toward dehumanization exist when any process becomes routinized.^[5] The scientific method is a routine, as is much of policy implementation through the application of standard operating procedures.

It has often been argued in the medical community that professional expertise and “compassion” of physicians for human subjects are a better way to protect the rights of patients than external constraints on their behavior, despite evidence that these individual qualities are often ineffective.^[3–6] Even with physicians, the effectiveness of an individual’s integrity depends on, and interacts with, professional ethical standards and institutional reward systems, as well as formal and informal positions of power and autonomy; such concern-producing conditions sufficient to protect the subject occur rather infrequently.^[7] The “compassion” or desire to make good decisions is often misguided or misplaced, particularly when the subjects are regarded by society as “less than human.” Dr. John R. Heller, the Director of Venereal Disease for the PHS from 1943 to 1948, claimed, even after penicillin was being used to treat syphilis in 1943 that, “The men’s status did not warrant ethical debate. They were subjects, not patients; clinical material, not sick people.”^[2]

BACKGROUND AND DEVELOPMENT OF THE TUSKEGEE STUDY

The purpose of the study funded by the Rosenwald Memorial Fund, a Chicago-based philanthropic foundation, was to track the prevalence of syphilis among African-Americans in the 1930s as a way of determining the practicability and potential effectiveness of mass control of syphilis. The project began in 1929 as a syphilis control program using the standard therapy of the time—heavy metals treatment.^[3] Conducted in six rural counties with diverse social and economic characteristics, this was the first attempt to systematically control venereal disease in rural areas.^[8] The study’s findings, which were reported at the 1932 Annual Convention of the National Medical Association at Howard University, were that socioeconomic characteristics had a greater impact on the prevalence of the disease than race, and that syphilis is not a racial disease.

Public health officials were concerned with remaining technical issues, such as the evaluation of blood tests for latent syphilis, which required 10–20 years before resulting in an outcome. The Rosenwald study did not resolve questions about the effectiveness of serological evaluations vs. autopsy examinations, and the general belief that syphilis was a “disease of small consequence to the Negro” persisted.^[9]

This is the environment within which the Tuskegee study took place. Officials’ low confidence in blood

tests for latent syphilis and the broad acceptance of racial hygiene theories contributed to pressures for a study centering on the observation of untreated syphilis in the latent stage through autopsy as a way of verifying the presence of syphilitic destructive lesions.

For the Tuskegee study, PHS selected Macon County, AL—the poorest of the six counties included in the Rosenwald study and the county with the highest syphilis prevalence rate (approximately 40%).^[9] The study involved 399 African-American men diagnosed with syphilis and a control group of 201 African-American men who did not have the disease. The men were told by the researchers that they had “bad blood”—a local term describing various common ailments. Informed neither of their actual diagnosis nor the nature of the illness, they were not provided proper treatment.^[3] The Tuskegee study disregarded virtually all of the principles of the Nuremberg Code. A copy of the Nuremberg Code is posted at the U.S. Holocaust Memorial Museum’s web site. Of particular importance are the unnecessary physical and mental sufferings and injuries, and the continuation of the experiments despite reason to believe that death or disabling injury will occur. The problem of syphilis was already solved, and the risk of death in the study was 100%. Participants were subjected to a painful spinal tap in the initial phase of the study, and researchers documented the untreated pain resulting from a curable disease in 399 men for 40 years.

Dr. Vonderlehr of the PHS began the experiment in 1932 by offering a painful lumbar puncture as a “special free treatment” that was actually a diagnostic procedure performed strictly for the benefit of the researchers.^[3] Following this examination, a letter was sent to each of the participants offering special free treatment for “bad blood,” and an African-American nurse from the area, Eunice Rivers, was used to convince the men to participate in the study. The participants consisted of rural farmers who owned their homes, renters considered permanent residents, and day laborers. Five hundred twenty of the original 600 men received consistent follow-ups to the point of autopsy.^[1] In exchange for participating in the study, the men were offered free medical exams, free meals on the days of the exams, free rides to and from the clinics along with an opportunity to shop or visit friends in town on the return trip, free treatment for minor non-syphilitic ailments, and burial insurance.^[1]

The program involved annual examinations by a “government doctor” in which the men were given a physical examination to document the effects and progression of the disease.^[1] They were also assessed for non-syphilitic conditions and provided with advice and medication (when it was available) for other ailments.^[1] The men were given mercurial ointment (which was known to be completely ineffective against

syphilis) and dosages of neoarsphenamine or arsenic in amounts short of what would be necessary to stop the infection under the false pretense that the drugs would cure the men of their “bad blood.”^[3]

The PHS began using penicillin to treat syphilis in 1943, but despite the safe and effective treatment history and general availability by 1953, penicillin was deliberately withheld from the participants.^[3] In fact, the PHS went to the extremes to prevent the study participants from receiving any form of treatment for syphilis. PHS distributed lists of names of participants to local physicians instructing them not to provide penicillin to the men involved in the study, and when about 50 of the men were drafted during WWII, PHS requested that the draft board not test or treat the men for syphilis; the board complied.^[3] In 1943, when the PHS established “Rapid Treatment Centers” across the country to systematically treat syphilis, no clinic was established in Macon County so as not to disrupt the study.^[3]

By not treating the men in the study and by not informing them of the nature of the disease, the PHS contributed to the spread of the disease to many women and infants who acquired congenital syphilis.^[3] As such, the PHS, the draft board, the Macon County Medical Society, the Alabama State and Macon County Boards of Health, the Tuskegee Institute, and all of the physicians involved violated Alabama law by failing to treat a communicable disease.^[3] As many as 100 of 399 participants are believed to have died from syphilis over the course of the study.^[10] In 1950, Dr. Wenger of the PHS noted, “. . . we have contributed to their ailments and shortened their lives.”^[3]

In 1968, Peter Bauxum, a PHS venereal disease interviewer and investigator, and others raised concern over the ethics of the Tuskegee study. The CDC responded by reaffirming the need for the study, and gained the official support of the local American Medical Association and the National Medical Association for the study’s continuation.^[3] The first news articles condemning the study appeared in 1970, and, in 1971, Congress held hearings to investigate the scandal. In 1972, the Assistant Secretary for Health and Scientific Affairs (ASH) appointed an Ad Hoc Advisory Panel to review the study, which concluded that the Tuskegee study was “ethically unjustified.” In November 1972, the ASH announced the end of the Tuskegee study.^[3]

IMPLICATIONS FOR PUBLIC POLICY AND PUBLIC ADMINISTRATION

The legacy of the study at Tuskegee has reached far and deep in ways that hurt our progress and divide

our nation. We cannot be one America when a whole segment of our nation has no trust in America.^a

The Tuskegee study remains a primary and widely cited example of research that lacked adequate protection for the participants. The study violated a number of ethical principles that are now regularly applied to human subjects research. The study used disadvantaged, rural black men to study the untreated course of a disease that is not confined to that population, placing an undue burden on that population and placing at risk a broad population. The study not only failed to minimize the risks to the participants, but increased those risks by depriving them of treatment long after it became available. The 600 men involved in the study were not afforded informed consent, even after the Nuremberg Code was written in 1946, codifying the need for voluntary consent. It may be that the lack of education of the participants made informed consent difficult; most were illiterate, many did not even know their last name, and the best educated participants had only completed 8 years of school. However, it is widely accepted that this disadvantaged position only accentuates the need for the protection that administrators have an obligation to serve.

Along with others, this study provided a broad impetus for federal regulations that guide the practice of research. The resulting policy requires research proposals to be reviewed by a human subjects committee; only research meeting the standards for the treatment of human subjects are approved by the committee and capable of being carried out. The Department of Health and Human Services now implements the federal policy for the protection of human subjects, and the policy is integrated into the procedural process of every public and private organization conducting research involving human subjects in the United States. Further, information about the federal human subjects research guidelines can be found at the United States Office for Human Research Protections (<http://ohrp.osophs.dhhs.gov/index.htm>).

The Tuskegee study also has implications for a lasting difficulty in the evaluation and analysis of medical policy and interventions: the concern among African-Americans that the scientific establishment does not fully address their concerns about the protection federal regulations provide them. “Distrust of the white-dominated medical community, either because of Tuskegee or the long history of subordination of blacks in this country at the hands of whites, obviously

^aThe formal apology issued by President Clinton on May 16, 1997, taken from Ref.^[11].

plays some role in the reluctance of black people to participate in clinical research . . . It is critical for black people to become involved in this type of research in order for skilled clinicians to determine if any measures can be taken to reduce the incidence of a number of diseases that befall black people at a far greater rate than whites.’’^[12] The hidden effect of Tuskegee is the inability of evaluators and analysts often to pull together the type of diverse and rich human information about the real effects of health policy across various segments of the population that are necessary to change policy outcomes in the long run.

CONCLUSION

Individual integrity without proper institutional constraints often results in misguided decisions. At least 16 reports on the Tuskegee experiments were published in reputable journals such as *Public Health Reports*, *Archives of Internal Medicine*, *Journal of Chronic Diseases*, *Milbank Fund Memorial Quarterly*, *American Journal of Public Health*, *Journal of the American Medical Association*, and *New England Journal of Medicine*.^[13] Yet, even though individuals with integrity who read these studies or participated in these experiments may have had compassion and concern for human subjects, that compassion did not result in the ending of the study for 40 years. However, even with external constraints provided by federal regulations for the protection of human subjects, a lack of individual integrity on the part of the researcher can result in unethical practice. Neither compliance nor integrity alone prompts ethical practice, but instead, serving the public interest requires that external institutional accountability and individual integrity reinforce one another.^[14]

U.S. Office of Personnel Management

Teva J. Scheer

University of Colorado at Denver, Highlands Ranch, Colorado, U.S.A.

INTRODUCTION

The U.S. Office of Personnel Management (OPM) is the central personnel agency for the United States' federal government. It was established in 1978 as a result of the civil service reform measures promulgated by the administration of President Jimmy Carter. At its founding, the primary goals of OPM were to serve as the President's primary advisor in personnel matters, to establish government-wide personnel policies, and to assist federal executives and managers by simplifying the personnel rules and regulations. Assessments of OPM's effectiveness after almost 30 years of existence are, at best, mixed.

WHY OPM?

In 1977, shortly after President Carter appointed him Chairman of the U.S. Civil Service Commission (CSC), Alan K. Campbell instituted an in-depth study, called the Federal Personnel Project (PMP), of the charges made by federal executives, managers, and employees that the complicated body of personnel rules and regulations were hurting morale and—even worse—sapping public confidence in the federal civil service system. The original civil service system had been established under the Civil Service Act of 1883, which had been designed to curb undue political influence over the civil service. The body of laws and regulations that were the focus of the PMP's analysis had been developed to support that goal and to create a neutral, merit-based system. However, after several months of study and consultation with some 800 organizations and individuals, the PMP concluded that the problems with the existing civil service structure were “so pervasive and fundamental that merely patching the existing system [would] not solve them.”^[1]

Among the most critical issues that the PMP identified were:

1. Managers were confused about what they could do without violating merit principles; the rules were so complicated that even good-faith compliance was difficult.
2. Excessive centralization of personnel hindered the decision-making prerogatives of line managers and required managers to prepare

voluminous justifications to obtain CSC approval of minor actions such as extensions of temporary appointments.

3. The “confusing array of regulations and procedures” made it difficult for managers to reward good performance, discipline employees, and remove employees who failed to meet performance or conduct expectations.^[1]

As a result of the PMP findings, President Carter submitted Reorganization Plan No. 2 of 1978 to the U.S. Congress. The Plan proposed to create two new agencies to replace the CSC. The OPM would be the President's principal advisor on personnel matters, and it would be responsible for government-wide personnel policy as well as for administering the CSC programs for recruitment, evaluation of agencies' personnel programs, training, health and retirement benefits, pay systems, background investigations, and training. Its overriding goal would be to simplify the system, decentralize authority to agencies, and give federal managers the tools they needed to manage. The CSC responsibility for adjudication of employee appeals would be given to the Merit Systems Protection Board (MSPB) so that OPM could concentrate on its mission as a management advocate. In response to Congressional concerns that the new OPM would be subjected to undue political influence, the PMP director testified that he was confident the new OPM director would be under no more pressure than the former CSC Chairman, he stated: “I think we ought not to be afraid of the President being associated with management, because he is the one who is being held accountable by the voters of this country for carrying out programs.”^[2]

On March 2, 1978, President Carter followed up on Reorganization Plan No. 2 by submitting to Congress a bill to reform civil service laws, which was entitled the Civil Service Reform Act of 1978 (CSRA). After lengthy hearings and numerous amendments to the original bill, Congress passed the CSRA. President Carter signed the Act on October 13, 1978. On January 1, 1979, the OPM became a reality.

ASSESSMENTS OF OPM'S PERFORMANCE

Many scholars and practitioners would say that OPM has failed to live up to the goals set forth in the CSRA.

The first OPM director, Alan K. Campbell, had a clear leadership vision for the new agency as well as the strong support of President Carter. However, the second director, Donald Devine, was appointed by President Reagan, who excoriated the government during his campaign. Devine replaced “OPM’s traditional management orientation with an unswerving emphasis on responsiveness...solely to political direction,” according to one observer (L. Lane, as quoted in Ref.^[3]). During Devine’s tenure, OPM began a long, probably irreversible, decline in agency budget, staff, and even mission; for example, during the 1990s, OPM jettisoned its role as the government’s primary training provider. Subsequent directors to Devine, while well-meaning, each changed OPM’s goals and priorities in response to their presidents’ individual policy directions.

In addition to introducing new personnel policies, each President had his own ideas about how to reform government. When Vice President Al Gore instituted the National Performance Review to “reinvent government,” OPM director James King led the way by further downsizing his agency and abolishing the *Federal Personnel Manual*. In sum, it appears that the director of President Carter’s PMP erred in his 1978 assessment that OPM would not be unduly affected by partisan policies.^[4,5]

By 1988, the National Academy of Public Administration had declared that there was a “quiet crisis” in the federal service. The government was failing to attract, develop, and retain the quality work force that it would need to meet the challenges of the next century. The Office of Personnel Management must lead the charge for solutions; but it could not do so unless the agency had a “clearly defined mission and the capacity to perform that mission.... The position of OPM director must be recognized as one of great importance to the long-term effectiveness of the new administration.”^[6,7] But a 2002 assessment pointed out that OPM’s influence had become so negligible that the Office of Management and Budget was leading President Bush’s competitive sourcing initiative, under which about 850,000 government positions will be subject to competition with private companies who can demonstrate their ability to perform the same work more cost-effectively.^[8,9]

On another critical front, numerous agencies have given up on the government-wide regulatory umbrella administered by OPM, and have successfully sought Congressional approval to opt out of key provisions of Title 5 of the United States Code. Key among these agencies are the Internal Revenue Service, the Department of Homeland Security, and the Department of Defense. Although OPM officially supports these initiatives, analysts are left wondering what role will be left for the central personnel agency if most federal

departments are granted the authority to design their own systems.^[10]

AND THE FUTURE?

In 2003, one scholar, who was himself a key member of the PMP staff that laid out the framework for civil service reform, regretfully described OPM as a “toothless Chihuahua” (Lee,^[10] quotation from Chester A. Newland). The agency is positioning itself to become a consultant to agencies rather than their regulator, but OPM’s loss of staff and expertise has left it competing with an array of private contractors, many of whom developed their own expertise while working for OPM. The question is whether the federal government still needs an agency to provide the leadership of a central personnel agency. The original goals of the Civil Service Reform Act of 1973 were to decentralize authority to managers and to reduce the burden of regulations and paperwork, so perhaps OPM’s mission is complete and the individual agencies can carry on, tailoring personnel systems to their own unique missions and needs. In sum, is there any reason for the continued existence of OPM?

The central question to be answered by Congress and policymakers in the executive branch is whether they perceive continued value in the existence of a government-wide personnel system. Should each agency have the flexibility of an independent corporation to manage its workforce? Or are there standards of selection, pay policy, and performance management that should apply to all federal employees—and for that matter, to the thousands of federal contractors who now perform work formerly limited to the “federal service”? Should employees be accorded due process before they can be separated, or would the government benefit more from a flexible, at-will termination system? Should federal employees continue to enjoy protection from political pressure? Should they all be held to the same standards of conduct and ethical behavior?

In sum, do policymakers support the concept of an American civil service? If the answer is affirmative, then there remains a critical role for OPM. The challenge for OPM will be to carve out for itself the strong leadership role envisioned in the Civil Service Reform Act of 1978—a role that many believe the agency has lost.

Uncertainty in Decision Making

William J. Mead

Consultant, White Plains, New York, U.S.A.

INTRODUCTION

In decision-making and problem-solving processes, it is obviously preferable to have complete, consistent, and accurate information. However, unfortunately, all too often, the information available to us is necessarily less than perfect. There may be missing or unknown elements that are of significant importance. The “facts” we have may or may not be fully correct, or may be ambiguous. Measurements and data may be less than precise. Some decisions involve complex systems, where what happens in one part impacts other parts, which can introduce complications. All of this points to the unavoidable reality that *uncertainty*, the lack of being sure we know all we need to know to make a good decision, is often a confounding issue.

OVERVIEW

Blau and Sinclair^[1] defined uncertainty somewhat differently, saying that it is the randomness of the external environment that cannot be changed but only managed. They likened this to the weather, where people may be aware of the prediction that rain is probable, over which they have no control, but they can manage their exposure by carrying an umbrella.

As Merry^[2] said, we feel a need for regularity and predictability in all we do, and we strongly seek order and constancy even in the face of unrelenting change. So, dealing concurrently with partial predictability and partial uncertainty tends to pose difficulties for all of us, on a psychological level and on a practical level.

The advent of computer technology has greatly improved our ability to collect and store data, but this has not necessarily enhanced the accuracy, precision, or completeness of the available information needed for decision making. Moreover, with today’s vast databases, it is frequently difficult to sort and find the desired information in the format that would be most useful. Therefore, today’s information technology is only a partial step toward reducing uncertainty.

March^[3] said that decision makers choose among the alternatives open to them on the basis of their expected consequences, but often, those consequences are not known with certainty. He used the example

of a food vendor at a football game deciding how much of each item he should take to the stadium. His actual sales of each item depend on many variables, such as the weather and the spectators’ interest in the particular game. His decisions must be made under uncertainty, and the results may or may not be favorable. The outcome may be pleasant or unpleasant for the vendor, and he is likely to suffer regret in any event at being left with unsold goods or having lost possible sales by having been too conservative. This same type of phenomenon often occurs in the more significant decisions required in public administration.

Kiel^[4] pointed out that uncertainty is inevitable in our private lives and in public management. Because of chaos and complexity in our nonlinear world, it is impossible to completely avoid unintended and unwanted outcomes of our decisions and actions. Clearly, this impacts policy making and the regulatory process. Therefore, it is essential to realize the constant pressure caused by uncertainty. The role it plays cannot simply be ignored. Instead, it must be understood, appreciated, and dealt with as best as possible. Good decisions *can* be made even in the face of uncertainty, but it is important to remember that some measure of doubt always lurks in our deliberations and plans.

Risk and uncertainty are related but not identical topics. Risk presupposes we can identify and quantify all of the factors in our decision making, so that we can assign probabilities, and we know the consequences of all of the possible outcomes, which enables us to take appropriate actions to minimize the possible losses. In contrast, under uncertainty, some of the outcomes and probabilities of their occurrence are unknown; therefore, it is much more difficult to arrive at a suitable decision.^[5]

Many of the major decisions faced in public administration are complex and difficult, including those involving changes in the natural environment, such as global warming, the fragility of the ozone layer, correction of flood zones, the control of acid rain, whether genetically modified crops are sufficiently safe, and many others. Issues of how best to control traffic flow in congested areas, and zoning to prevent urban sprawl, also involve uncertainty. In addition, there are public health decisions laced with uncertainty, such as whether to approve or ban certain pesticides, issues on control of air quality for outdoor and for indoor

air, whether or not electromagnetic fields from high-tension power lines or cell phones pose substantial risk, and whether specific new drugs should or should not be approved for use. These, and many similar matters, not only involve high levels of uncertainty, but they also tend to be politically loaded and may have high visibility to the public, often resulting in major disagreements between groups holding opposing views. It should then be obvious that decisions involving considerable uncertainty are difficult and tricky at best, and it is important to be familiar with some of the methods and techniques of approaching resolution of the issues.

MEANS OF COPING WITH LESS-THAN-ADEQUATE INFORMATION

Mathematical Computer Models

An important aid in decision making under uncertainty, in those instances where appropriate, is the use of mathematical computer models. This approach is relevant for highly complex topics, where information is still being gathered. Various modeling techniques and programming skills are used to simulate conditions. Models, by their nature, are incomplete descriptions of reality but are simplified approximations. But, even with this caveat, they are extremely useful in studying complicated interactions by varying certain parameters. For example, models are widely used in studying global warming, to assist in decision making regarding the steps necessary to curtail this phenomenon if it needs to be curtailed.

The use of models in this way is, of course, an outgrowth of advancements in information technology in recent years. Prior to the advent of high-speed computers, it was generally not feasible to make extensive use of models.

One practical problem with using complex models of social, economic, and environmental systems is that most people have difficulty understanding them, which tends to make policy formulation somewhat difficult.^[6]

Expert Judgment

In the absence of extensive and reliable data, it is not unusual to solicit judgement from qualified experts in the specific field. In some instances, multiple judgments are combined by using groups of experts. While subjective as opposed to quantitative, this approach is a logical effort to get useful input to help the decision makers with their tasks.

One approach is to split the subject matter into definitive variables and parameters, and then ask the

experts to indicate their views on the likelihood of events occurring and the probable consequences of these events if they do occur. This was one of the tools used in a report on climate change, from an international panel, for example.^[7]

When expert judgment is used, the methods of getting the opinions should be well documented by identifying the experts and why they were considered to be qualified, and by detailing how their judgments were obtained. If there is any significant disagreement among experts, this should be spelled out. Having these methods clearly documented allows a review of the process used and helps make it possible to repeat the exercise to show that the results are reproducible.

Although experts may be well qualified technically, they are subject to inadvertent human biases. Psychological research has identified certain inferential rules, known as *heuristics*, people tend to use to assimilate what they know about a given topic and to judge how likely specific events are to occur and the probable consequences if they happen. These “internal rules” can lead to biases. Therefore, it is important to compensate for these cognitive biases in judgment.^[8,9]

Statistical Decision Theory

There are a number of statistical tools that can be helpful in attempting to quantify a situation, even in the face of uncertain information. Collectively, the use of such tools is called *statistical decision theory*, which has become a separate discipline. Advanced degrees are now offered in this field, and a considerable body of literature has evolved.^[10–12]

The tools are based on the laws of probability, which can express the likelihood of an event occurring under specified conditions. In simple cases, such as flipping a coin or rolling dice, the likelihood of any given outcome can be known with precision. But, in more complicated scenarios, such likelihoods are not clear and can only be estimated in a subjective way. The mathematics involved can be quite daunting. But, regardless of the difficulties involved with these procedures, they provide information useful to decision makers, plus they provide a useful means of communication.

In addition to mathematical methods based on classical statistics, there is another useful variation on the theme, called Bayesian statistics. This approach is named after the founder of this school of thought, a Presbyterian minister named Thomas Bayes who first proposed the concept in the 1700s. This approach has gained prominence and rather wide acceptance in recent years, for dealing with uncertainty. In essence, in addition to the laws of probability, the Bayesian approach also considers the degree of belief the

decision maker has that a given event will or will not occur, based on knowledge of the matter as well as on any new information that has been acquired. Obviously, Bayesian statistics involves a certain amount of subjectivity, but this fits nicely with the concept of uncertainty. With the rebirth of interest in the Bayesian approaches, this method is now taught in various colleges and universities, and a body of literature has developed around it.^[6,13–15]

Decision Analysis

Another useful tool now rather widely accepted for dealing with uncertainty is called *decision analysis*. This uses a number of techniques for achieving its goal of focusing on the relative merits of the various alternatives open to the decision-maker.^[16] Skinner defined decision analysis as being a methodology based on a set of probabilistic frameworks that facilitate high-quality, logical discussions, leading to clear and compelling action by the decision maker.^[17]

There is now a Decision Analysis Society, with a web site^[18] offering bibliographies and reprints of papers on decision analysis and its techniques.

Monte Carlo Analysis

In applying probability theory to observed data, it is important to determine whether chance alone can account for the results of observations. If not, other factors, including system bias, may be involved. A probability distribution describes the range and frequency of data related to events or specific measurements obtained. Often, but not always, such distributions when graphed appear in the form of the familiar bell-shaped “normal distribution” curve. However, other collections of data result in nonnormal distributions, complicating the application of the rules of probability. Both where bias is suspected, and where multiple factors are involved (some of which may have non-normal distributions), a technique called Monte Carlo analysis may be used.^[19] The name comes from the famous gambling casino in Monaco, where games of chance exhibit purely random but predictable behavior. In rolling a pair of dice, all possible outcomes are known, but the results of any given roll are not. If the data on the outcomes of a large number of rolls show that the frequency of specific values fails to match what would be predicted by probability theory, it is obvious that some sort of bias exists. For example, one die, or both dice, may be inadvertently or deliberately imperfect in dimensions or weight distribution. This is one kind of application of the so-called Monte Carlo method.

Somewhat similarly, in complex studies where there are several variables interacting, it can be of importance to take into account the impact of each source of variability and uncertainty as part of a decision-making process. This requires identification of each of the important parameters involved, and then attempt to determine the probability distribution of each. Sometimes, this requires using some human judgment, when mathematical approaches are not feasible. In doing so, variability (true inherent heterogeneity in the data) is separated as best as possible from uncertainty (lack of full knowledge of the situation). Once these factors have been established, the next step is to calculate many (often tens of thousands) scenarios, selecting differing input values for each of the probability distribution curves. This generates one overall distribution curve for the output of the model. In other words, this is a method of analyzing the effects on the final state of the system of varying inputs, in the face of uncertainty. An example of the kind of situation where such methods are useful would be in studying the potential hazard of radon in tap water used in household showers, where the amount of radon in the water, the range of water temperatures, the frequency of showering, and the typical duration of each shower are all factors requiring consideration. Fortunately, software programs are available to handle the immense number of calculations involved with this sort of application of Monte Carlo analysis.^[20–22]

Decision Trees

Another of the tools is what is known as the *decision tree*. This is a technique of graphically expressing the various factors involved in a decision-making process, showing the various alternatives and expected consequences in a logical and relatively easy-to-understand format. It lays out the issues to facilitate seeing the choices, the possible outcomes, and the probabilities of each outcome. In other words, it is an effective way of organizing a summary of a decision-making situation. It is called a “tree” because the graphics resemble a tree, with major branches subdividing into smaller branches and then into twigs.^[23–25]

CONCLUSION

Uncertainty is unfortunately a very real factor in arriving at decisions in many instances. It is essentially unavoidable in some situations, particularly those involving complex and unclear issues, such as environmental protection, climate change, and health protection. It is of great importance for those in decision-making positions in public administration to recognize the role of uncertainty and to be familiar

with the methodologies available to help make good decisions even when uncertainty is a significant factor.

Uncertainty, Concept of

James McBain

*Department of Social Sciences, Pittsburg State University,
Pittsburg, Kansas, U.S.A.*

INTRODUCTION

Uncertainty refers to a psychological state of agents when they do not possess the property of having sufficient epistemic justification for a belief. There are two basic ways to analyze the concept of uncertainty—epistemologically and decision theoretically. The former concerns the epistemic status of a belief and the latter concerns the knowledge of the probabilities of an outcome for a decision. Both analyses are important in public policy in that^[1] uncertainty is a feature of countless policies, and^[2] the way of thinking of this concept changes depending on whether we are asking questions concerning the future, present, or the past, theory or application.

PROPOSITIONS AND POSSIBLE WORLDS

While uncertainty is a psychological state of agents, it should be clear that it is not a property that agents have, rather it is a property that is ascribed to a belief that an agent has. Uncertainty attaches to the propositional content of a belief the agent has. In this light, it is more precise to say that propositions are uncertain (or certain), not agents.

While propositions are usually expressed as declarative sentences, which can bear truth and falsity, they should be conceived of as sets of possible worlds. Possible worlds can be understood as descriptions of the way the world might be or has been. In conceptualizing uncertainty, we must understand that uncertainty represents some set of possible worlds where the proposition does not hold. The proposition “Stella is going to vote today” corresponds to the set of worlds where Stella heads off to the voting booth to vote. If we were uncertain of whether Stella would be voting today, there would be some set of possible worlds in which Stella does not go to the voting booth or, once there, cast a vote.

The introduction of possible worlds raises numerous questions. Are possible worlds ontologically real? How are we to reason with possible worlds? Are the worlds finite or infinite? Although such questions are

important and answers to them necessary, we should not dismiss the necessity of using possible worlds in understanding the concept of uncertainty.

AN EPISTEMOLOGICAL ANALYSIS

In its common locution, the phrase “I am uncertain that p ” (where p is any proposition) refers to an agent lacking the level of justification needed to be certain in an absolute sense of the truth of the proposition. To say “Stella is uncertain who will win,” is to say that Stella does not have the warrant needed to be certain of the truth of who will win. More precisely, one is uncertain when one is justified in believing the proposition, but there is a possibility of the proposition’s being false. This reading of uncertainty is derived from the Cartesian tradition. According to this tradition, an agent is certain that p , roughly, when she is justified in believing p and there are no possible grounds to doubt p . While it is a matter of epistemological debate as to how to characterize those grounds, we can take it that if the grounds reduce the level of warrant one has for the proposition, she is no longer certain. Hence, to be uncertain is to be justified in believing p , but for there to be some ground the agent is warranted in believing, which added to the agent’s other beliefs, reduces or removes the warrant for p .

Such an analysis is important in understanding the concept of uncertainty in everyday situations as well as appealing to evidence concerning the past or the present (we will reserve discussing of the future for the decision theoretic analysis). Suppose an administrator needs evidence as to whether there is some statute, which would inhibit a certain course of action. Normally, such evidence would come from those who do research for the administrator. As such, the evidence would be testimonial in nature. The administrator would need a way of determining whether the testimonial evidence she is receiving is certain or uncertain. One such way would be to assess whether there is some possibility of the testimonial claim being false. Is it the case that the researcher reads the literature and

case studies accurately? Is there some possible precedence that was set at a later time than what the researcher was using as evidence? Essentially, the administrator would be asking whether there is a possible world in which the researcher was mistaken in her acquiring and reporting the information. If there was, then the administrator's belief is uncertain.

While many may dismiss an epistemological analysis as not being practical, in that such analyses invites skepticism about ever achieving certainty about a belief, we must be careful to recognize that many daily judgments concerning policies require answers to questions of uncertainty, which pertain to evidence that one has or is researching. When appealing to testimonial evidence, administrators should be careful to recognize possible situations (possible worlds) in which they should not take their beliefs to be warranted and hence would require further warrant.

A DECISION THEORETIC ANALYSIS

In decision theory, a judgment under uncertainty (sometimes referred to as a "judgment under ignorance") is a choice by an individual or a group between two and more alternatives (acts), which will produce an outcome, but (some or perhaps all of) the probabilities of the outcomes are unknown or meaningless. This is contrasted with a judgment under certainty, which is a choice between acts of which one is certain of the specific outcomes. Judgments under certainty are fairly easy to assess, in that all an agent needs to do is to determine the most desirable outcome and act accordingly.

Judgments under uncertainty should further be contrasted with judgments under risk, which are choices between alternative acts where the probabilities of the outcomes *are known* or treated as known. Choices between options of parlor games such as roulette, craps, and card games are common examples of judgments under risk. In such games, the agents know the probability of the possible outcomes and bet according to what they believe is best in light of their desires and/or preferences. It is sometimes also useful to treat certain decisions as judgments under risk when it is of pragmatic value to assign a definite probability to the outcome. Examples of such behavior are investment decisions, sports gambling, agricultural decisions, and marketing decisions. So, where it is possible to assign probabilities to all the outcomes, it is a decision under risk. If it is impossible to assign the probabilities to all the outcomes or it is meaningless to do so, it is a decision under uncertainty.

Hence, "uncertainty" in decision theory refers to the realm of judgments where the probability of one

or more of an act's outcomes is completely unknown or meaningless. To be more precise, a judgment under uncertainty is a choice among a set of acts ($A_1, A_2, \dots, A_n$), where the desirability of the act is contingent upon which possible outcome ($O_1, O_2, \dots, O_n$) prevails, but the probability of $O_1, O_2, \dots, O_n$ is unknown or meaningless.

Policy decisions are often made under uncertainty. The outcomes of decisions made by administrators may depend on a state of affairs whose actuality may not be known at the time the decision is or needs to be made. One such controversial example is the Precautionary Principle. The Precautionary Principle has been applied to domains such as the production and consumption of genetically modified foods, aeronautics, pollution, species extinction, public health, and others. The Precautionary Principle states that whenever some action increases the threat of harm to (or decrease in the safety of) human health or the environment, precautionary actions ought to be taken even if some causal relationships of the threat are not scientifically established. The Precautionary Principle advises to err on the side of caution when facing a decision under uncertainty, in which the outcome is possible harm to human and/or the environment. Given that the probabilities of the outcomes of decisions are unknown (which in this case means scientifically unjustified), whether to appeal to this principle qualifies as a decision under uncertainty. As this is a decision under uncertainty, questions as to whether to accept this principle would turn to questions of the value of human welfare, the immediacy of the possible threat, what technologies are available to cope with the possible threat, etc.

An analysis of the moral status of the Precautionary Principle is beyond the scope of the analysis, but what is important to note is the commonality of policies being decisions under uncertainty. For many (if not most) policy decisions, the concept of uncertainty is present as many policies are based upon scientific certainties or guaranteed future states of affairs. Policy makers hence must recognize when policies involve uncertainty and when the probabilities of the outcomes are known or are not meaningless.

CONCLUSIONS

The basis of this explication of uncertainty has been conceptual. To apply the concept of uncertainty to various beliefs and decisions, we must first have a more precise concept. From this foundation, we can venture to ask other questions concerning the use of uncertainty in policy decisions. What is the best way to represent uncertainty formally? What rules

are best to apply in decisions under uncertainty (MaxiMin, MiniMax Regret, etc.)? Once we understand the concept of uncertainty, it is possible to address such theoretical and practical questions more efficiently.

Understanding the Basics of Refunding in the Municipal Bond Market

Jun Peng

*School of Public Administration and Public Policy, University of Arizona,
Tucson, Arizona, U.S.A.*

INTRODUCTION

Refunding of outstanding debt is probably the most important management activity after the debt has been first issued in the primary municipal bond market, as long as the issuer's debt-paying capacity does not deteriorate. Refunding, in a nutshell, means issuing new debt to retire outstanding debt. The primary purpose of refunding is to lower the borrowing cost.

Although there are key differences, the best analogy of refunding in the municipal bond market is mortgage refinancing in the residential housing market. When mortgage rate goes down, homeowners will take out a new mortgage loan to retire the old mortgage loan, which typically carries a higher mortgage rate, to reduce their monthly mortgage payment. This is, however, where the similarity between municipal bond refunding and mortgage refinancing ends. It is the differences between these two that make municipal bond refunding more complicated. To understand the major differences between the two, it is important to understand the concept of option first.

CALL OPTION AND ITS ROLE IN REFUNDING

In the financial market, option gives the seller of the option the right but not the obligation to engage in certain financial transactions. There are two basic options, call option and put option. Call option gives the issuer the right but not the obligation to purchase some financial products at a certain price and at a certain date, and it will be exercised only when the actual market price of the product is higher than the purchase price agreed upon in the contract. The put option gives the issuer the right but not the obligation to sell some financial products at a certain price and at a certain date, and it will be exercised only when the selling price agreed upon is higher than the actual market price. It goes without saying that such options do not come free of cost. Both issuers of call and put options have to pay a premium to have such kind of right.

It is the call option that is relevant in the case of municipal bond refunding. The vast majority of the municipal bonds are callable bonds. If a bond is callable, it is written in the official statement that the issuer can (although he does not have to) call back (or purchase back or redeem) the bond from the investors at a certain date in the future before the final maturity of the bond. The issuer, of course, has to pay a premium for having such a call option. Such premium is not paid up front when the bond is first sold but rather paid when the bond is purchased back from the investors in the form of call price. The call price is usually expressed as a percentage of the par value of the bond, such as 103% of the par value of the bonds. Therefore an investor with \$1000 worth of the bond can obtain \$1030 from the issuer when it is called back. The size of this call premium varies positively with the time period between call date and final maturity. The closer the call date gets to the final maturity date, the smaller the call premium will be. As a matter of fact, after some time period, the bond will be called back at par value. For example, if the bond has a final maturity of 30 years, it may be called back at 103% of the par value 10 years after the bond is first sold, whereas it will be called back at par 20 years after the bond is sold.

As mentioned earlier, the primary reason for refunding is interest cost savings. Therefore issuers will buy back old bond with proceeds from the new refunding bond only when the interest rate on the new bond falls below that on the old bond. This is where the call protection period comes in. The call option builds uncertainty into the financial planning of the investors who purchase the bonds. When the bonds are called back, investors are left with proceeds that will be invested at a lower interest rate, thus reducing their future investment income. To reduce that uncertainty, investors need some protection from very early redemption. Call protection stipulates how early the bond can be called (or redeemed). The call protection period usually has a 10-year span, which means that the bond cannot be called within the first 10 years. Call protection has an important impact on how refunding

is performed. Whether the refunding bond is sold inside or outside the call protection period determines how the refunding transaction is performed.

CURRENT AND ADVANCE REFUNDING

There are two kinds of refunding transactions: current refunding and advance refunding. In a current refunding, the proceeds of the refunding bond need to be used to redeem the old bond within 3 months after the refunding bond is issued. That means that current refunding should happen no later than 3 months before the last day of the call protection. In most cases, current refunding happens when the call protection period is over. When the interest rate drops, the issuer can issue refunding bonds at a lower rate to immediately retire the old bond. Therefore there is no need for investment of the refunding bond proceeds.

What happens when the interest rate drops and there are still several years before the call protection period is over? The issuer cannot do a current refunding because they cannot call back the bond within 3 months. To lock in the low interest rate even when they cannot call back the bond, the issuer needs to do an advance refunding. It is called advance refunding because the refunding bond is issued way in advance of the redemption of the old bond. It is this time lag that makes advance refunding a more complicated transaction because it involves the investment of the advance refunding bond proceeds and the coexistence of two bonds: the new refunding bond and the old bond (now also called refunded bond).

ESCROW ACCOUNT AND FEDERAL REGULATIONS

In an advance refunding transaction, the proceeds of the new bond are invested in an escrow account. The investment income is then used to pay the debt service on the old outstanding bond. At the end of the call protection period, the proceeds in the escrow account will be used to retire the old bond. Because the bond proceeds in the escrow account and the investment income will exactly match the debt service on the old bond till its redemption, the old bond is also considered escrowed to defeasance. Once the old bond is escrowed to defeasance, it is no longer considered a legal obligation of the issuer and will not appear in any financial statement of the issuer. Although there seems to be two bonds, there really is one bond, the new refunding bond, for which the issuer is responsible in terms of debt service payment.

Two aspects of the investment of escrow proceeds make advance refunding unique. One is the risk profile

of the securities to be invested in, and the second is the investment yield restriction. In order for the old bond to be fully considered escrowed to defeasance, the proceeds in the escrow account have to be invested in risk-free financial securities so that there is no doubt whatsoever about its ability to meet the debt service on the old bond. That usually means Treasury securities, which have no risk of default as they are backed by the full faith and credit of the U.S. government or other triple-A-rated fixed-income securities. This is where the yield restriction issue comes in. The yield restriction issue arises because of the tax exemption of municipal bond interest. As the interest on municipal bond is tax exemption, everything else being equal, the yield on municipal bond is lower than those on other financial securities including Treasury securities. Therefore the refunding proceeds in the escrow account will be invested at a yield higher than the yield at which the refunding bond is issued, leading to arbitrage profit for the issuer. Internal Revenue Service thus requires that the yield on the investment should be equal to, or restricted to, the yield on the refunding bond. Such yield restriction makes it very difficult to find the proper investment securities in the open capital market because such securities have to meet a certain profile regarding size, maturity, and yield. To accommodate the specific investment needs of state and local government issuers of advance refunding bonds, the Treasury Department created the State and Local Government Series (SLGS). These are Treasury securities tailored to the specific investment needs of each advance refunding transaction. Both the federal and local governments benefit from the SLGS, as the federal government can issue federal debt at a lower yield, and the local governments can easily meet their investment requirement without worrying about arbitrage.

Such convenience is not without its drawback. The dependence on SLGS for investment purpose renders advance refunding vulnerable to the vicissitudes of the financial market and the financial condition of the federal government. Whereas the yield on Treasury securities is slightly higher than that on the municipal bonds most of the time, it can actually fall below once a while. In 1998, when Russia defaulted on its debt, which led to a world financial crisis, investors sought safety in the Treasury securities. Such “flight-to-quality” substantially increased the demand for the Treasury securities, thus increasing the price and lowering the yield. The yield on Treasury securities fell below that of the municipal bonds, which did not enjoy the benefit of “flight-to-quality.” Advance refunding transactions came to a halt because the issuers would be forced to invest the proceeds at a yield lower than that on the refunding bonds. The federal financial condition matters because SLGS is part of the federal government debt and thus counted toward the federal

Fig. 1 Refunding volume and interest rate.

debt limit. When the federal debt limit is reached, which happens when the federal deficit worsens, as it did in fiscal year 2003 and again in 2004, the Treasury Department can no longer issue any debt. The Congress has to pass a bill to increase the debt limit before the Treasury can issue debt (including SLGS) again. Although the Congress never fails to do that, it takes time, and local government advance refunding becomes the victim during the waiting period.

While yield restriction is one federal regulation on refunding, the second federal regulation is that for each municipal bond, the issuer can advance refund only once because of the federal government's fear of overissuance of tax-exempt bonds if state and local governments are allowed unlimited advance refunding opportunities. This is another major difference between municipal bond refunding and mortgage refinancing. A mortgage loan comes with unlimited call options, which means that the homeowner can refinance his mortgage loan as many times as he wants. If the mortgage rate falls after he refinance for the first time, he can refinance again to take advantage of the even lower rate. State and local governments, however, cannot do that. Once they have refunded their bonds, they cannot refund them again even if the interest rate keeps falling. This happens between 2000 and 2003, when the Federal Reserve reduced interest rate many times to a modern-day low. Many issuers refunded their bonds when the interest rate fell early on in this period. When the rates kept falling, they could not do anything to further lowering their borrowing cost. Because of this, U.S. Senators Gordon Smith (Republican, Oregon) and Jon Corzine (Democrat, New Jersey) introduced S.271, the "Municipal Debt Refinancing Act," in January 2003 to permit states and local governments one additional opportunity to advance refund existing tax-exempt bonds within a 2-year window.

This bill is still being debated in Congress when this paper is submitted for publication.

OTHER PURPOSES OF REFUNDING

It is mentioned earlier that the primary reason for refunding is to lower the borrowing cost. This purpose can be seen in Fig. 1. The left vertical axis indicates the total national annual refunding volume between 1988 and 2002, whereas the right vertical axis is an annual average municipal bond interest rate index collected by the bond buyer.^a It is quite obvious that there is a very clear inverse relationship between refunding volume and interest rate.

Whereas lowering borrowing cost is the dominant reason, there are at least two other reasons that can also come into play. One important reason is to relieve pressure on government budget. Although lower borrowing cost is one way for immediate budget savings, restructuring debt service through refunding can also lead to immediate budgetary relief. In this case, the interest rate on the refunding bond may not necessarily be lower than that on the old debt. The primary objective here is to reschedule the debt service by lengthening the final maturity of the bond to lower the debt service payment right away. For example, after 10 years into a 30-year bond, the government decides to refund the old bond that has only 20 years left with a new 30-year bond. As long as the interest rates on the refunding and old bonds are fairly close, such restructuring does not lead to more debt service from a present value point of view, although the nominal amount of debt service will be higher for the refunding

^aData are collected from the Bond Buyer Yearbook.

bond.^b The worst-case scenario, however, is that the issuer is so desperate for immediate budget relief from debt service that it refunds the old bond with new bond that carries higher interest rate and longer maturity. Although such a move will lead to smaller debt service payment in the meantime, the issuer will pay substantially more in debt service over the life of the bond.

Another reason for refunding is to remove the restrictive covenants on the old bond. For various reasons, such as low credit quality, when the issuer first issued a bond, it put in place many restrictive covenants, such as requirement for debt reserve fund. Many years later, the issuer might be in a different financial situation and would like to remove these restrictive bond covenants. The only way to remove these restrictive bond covenants, however, is to retire the old bond, along with the restrictive covenants, with a new refunding bond that does not contain any of these restrictive covenants.

AN EXAMPLE

Finally, a basic example is used to illustrate the basic mechanics of an advance refunding transaction. City ABC issued a \$1 million 30-year bond at an interest rate of 6%. For reason of simplicity, the debt service is assumed to be level and paid annually. There is a call protection of 10 years. After 5 years, the interest rate dropped to 4%, and the city wanted to refund the bond at 4%. The annual debt service on the old bond was \$72,649, and the principal remaining at the end of the 10th year will be \$833,277.^c Therefore the total debt service on the old bond before its redemption will be five annual payments of \$72,649 and the final principal payment of \$833,277. The present value of this debt service payment stream discounted at 4% will be \$1,008,313, which also becomes the par amount of

the refunding bonds.^d This amount will be invested in an escrow account earning 4% to pay the debt service on the old bond before its redemption in another 5 years. The city will then only have to pay debt service on the new refunding bond. When the new bond is amortized over the next 25 years at the rate of 4%, the annual debt service on the new bond comes out to be \$64,544, resulting in an annual debt service saving of \$8105 for the next 25 years. The present value of total savings discounted at 4% is \$126,617.^e

One factor not considered in this example is issuance cost, which can cost up to 2% of the refunding amount, although it does not change the example in any significant way. Any reduction in interest rate does not immediately translate into an opportunity for refunding. There is cost involved every time when debt is issued, such as underwriting fee, legal fee, and credit rating fee, among others. It is like homeowners incurring closing cost when they refinance their mortgage. The interest rate has to fall to such an extent that at least the present value of future savings should cover all the cost associated with the issuance. Otherwise, it will be financially a net loss. It is probably caused by the concern that refunding should be approached cautiously and not be manipulated for budgetary purposes that some governments require that the refunding transaction can go ahead only if the present value of savings is at least 3% of the refunded bond. In the above example, this 3% rule is easily met even after deducting the issuance cost.

^bThis is because the present value of future all debt service payments is equal to the face value of the bond, which is the same for the refunded and refunding bonds.

^cFinding out the annual debt service is a present value of annuity problem, using the formulae

$$PV = A \left[\frac{1 - \frac{1}{(1+i)^N}}{i} \right]$$

where PV is present value (or the par amount of the bond in this case), A is the annuity (or annual debt service in this case), *i* is the interest rate, and *N* is the number of years to maturity. Because we know PV (\$1 million), *i* (6%), and *N* (30 years), we can solve the problem and find A to be \$72,649.

^dIt should be noted that the refunding amount is always greater than the amount to be refunded. This has to be the case because the refunding proceeds in the escrow account are earning at a rate that is lower than that paid on the old bond. To make up for the difference, the principal of the refunding bond has to be greater.

^eFinding out the present value of total savings is also a present value of annuity problem, as explained in footnote³. The difference is that now we know A (which is the annual saving of \$8105), *i* (4%), and *N* (20 years). Solving for PV, we find the present value of total savings to be \$126,617.

Uniform Guidelines on Employee Selection Procedures

Teva J. Scheer

University of Colorado at Denver, Highlands Ranch, Colorado, U.S.A.

INTRODUCTION

The Uniform Guidelines on Employee Selection Procedures were issued in 1978 by five agencies of the federal government to assist employers in complying with the employment non-discrimination requirements of the Civil Rights Act of 1964. This study explains the requirements of the Uniform Guidelines and discusses its current status.

BACKGROUND

Following the passage of the Civil Rights Act of 1964, the Equal Employment Opportunity Commission (EEOC) issued two sets of guidelines—the first in 1966 and the second in 1970—to assist employers in complying with the Civil Rights Act of 1964 as it related to Title VII of the Act (i.e., non-discrimination in employment practices). In 1971, the Supreme Court recognized the authority of the EEOC guidelines in its *Griggs v. Duke Power Company* decision when it concluded that the guidelines were an accurate interpretation of Congressional intent in passing the Civil Rights Act.^[1] *Griggs* was a landmark case in the field of employment discrimination. The Court ruled that the Duke Power Company's use of intelligence tests and high school graduation requirements violated Title VII of the Civil Rights Act because these selection tools deprived Black applicants equal opportunity in hiring and promotional opportunities. The Court's majority decision stated, "What is required by Congress [in the Civil Rights Act] is the removal of artificial, arbitrary, and unnecessary barriers to employment when the barriers operate invidiously to discriminate on the basis of racial or other impermissible classification On the record before us, neither the high school completion requirement nor the general intelligence test is shown to bear a demonstrable relationship to successful performance of the jobs for which it was used."^[2]

The *Griggs* decision heartened employees and applicants who believed they had been subjected to employment discrimination. It put employers on notice that they could face similar legal challenges, and it galvanized those federal agencies with responsibility for civil rights' oversight and enforcement. With regard to

compliance with Title VII, however, *Griggs* raised as many questions as it answered. Employers questioned, for example, whether Title VII's coverage extended beyond written tests to other selection methods, how to determine whether a selection tool was discriminatory, and the standard that employers should use to validate their selection processes. By the mid-1970s, three other agencies had issued their own interpretive guidelines that differed in certain technical aspects from those promulgated by the EEOC. This confusing state of affairs was finally resolved in 1978, when five agencies—the EEOC, the Office of Personnel Management, the Department of Justice, the Department of the Treasury, and the Department of Labor's Office of Federal Contract Compliance Programs—jointly issued the Uniform Guidelines on Employee Selection Procedures.^[3]

THE UNIFORM GUIDELINES—SUMMARIZED IN PLAIN ENGLISH

The Uniform Guidelines were written by psychologists, after which they were finalized by enforcement attorneys. Not all the psychologists were happy with the final version. In sum, while they provided generally helpful guidance to psychometricians, they were so difficult to interpret and understand that few human resources specialists have ever read them. Regrettably, most HR staff who work in the equal employment opportunity field, or who regularly develop ranking and selection processes, have only the barest understanding of this important document.

In a nutshell, here is the basic principle of the Uniform Guidelines: "The use of any selection procedure that has an adverse impact on employment decisions for any race, sex, or ethnic group will be considered discriminatory unless the procedure has been validated in accordance with the Uniform Guidelines."

An explanation of each part of this principle follows:

1. "The use of any selection procedure" refers to any single selection device or combination of selection devices that an employer uses for hiring or promotion decisions. These include written tests, performance tests (e.g., typing, driving, physical performance), interviews, evaluations

of experience and education (e.g., application form ratings), qualification standards, certification or licensure requirements, probationary periods, supervisory appraisals if used for selection, and training periods if used to determine future advancement.

Not included in the list of selection devices are bona fide seniority systems or recruitment procedures designed to attract applicants of groups under-represented in the agency or company workforce. The Uniform Guidelines also specifically exempt discrimination cases based on the Age Discrimination in Employment Act of 1967, as amended, or on sections 501, 503, and 504 of the Rehabilitation Act of 1973.^a

In 1982, the Supreme Court clarified in *Connecticut v. Teal* that even if an overall selection process has no adverse impact on a protected group, the process is still discriminatory if any one element of the process (e.g., a test or an interview) does cause adverse impact.

2. “Adverse impact” is defined using the “4/5s” or “80 percent” rule. The rule states that a selection rate for any race, sex, or ethnic group that is less than 4/5s (or 80%) of the rate for the group with the highest rate will generally be regarded as evidence of adverse impact.^b In other words, the Uniform Guidelines hold that selection rates for all race, ethnic, and sex groups in the applicant pool should be generally the same—but the guidelines allow for chance variation of up to 20%.

Table 1 displays two examples of 4/5s-rule computations. The first shows a comparison of male and female applicants. Thirty men, or 50% of all the men who applied, were selected, compared to 10 women, or 25% of all female applicants.

^aOn March 30, 2005, the Supreme Court issued its decision in a case brought under the Age Discrimination in Employment Act, *Smith v. City of Jackson, Mississippi*. The Court held that under this Act, adverse impact based on age is cognizable (i.e., it falls under the jurisdiction of the courts). However, the Court also held that the scope of age-based adverse impact determinations is narrower than under Title VII cases, which govern other types of discrimination. Age-based adverse impact is not unlawful if the employer can demonstrate that the practice or procedure that has caused the adverse impact is “based on reasonable factors other than age discrimination.”

^bHowever, the 4/5s rule is a guideline only. The Uniform Guidelines also state that “smaller differences in selection rate may nevertheless constitute adverse impact, where they are significant in both statistical and practical terms or where a user’s actions have discouraged applicants disproportionately on grounds of race, sex, or ethnic group. Greater differences in selection rate may not constitute adverse impact where the differences are based on small numbers and are not statistically significant, or where special recruiting or other programs cause the pool of minority or female candidates to be atypical of the normal pool of applicants from that group.”

Table 1 Two examples of the 4/5s rule

	No. of applicants	No. of selectees	Selection rates (%)
<i>Example 1</i>			
Males	60	30	50
Females	40	10	25
<i>Example 2</i>			
Blacks	40	10	25
Whites	50	10	20

Because the female selection rate is half that of the males—far less than 4/5s—the selection procedure has adverse impact on women. The second example compares the selection rate for Blacks and for Whites; their selection rates are 25% and 20%, respectively. As the ratio of 20/25 is 4/5, there has been no adverse impact.

3. “Employment decisions” include but are not limited to hiring, promotion, demotion, membership (for example, in a labor organization), referral, retention, and licensing and certification to the extent that the licensing process is covered by federal equal opportunity law. Other employment decisions, such as selection for training and transfer, may also be considered employment decisions if they lead to any of the other decisions listed in this bulletin.
4. The protected groups are specified in Title VII of the Civil Rights Act, which states that employers may not discriminate in employment decisions on the basis of race, color, religion, sex, or national origin.
5. A selection procedure is “valid” under the Uniform Guidelines if it predicts job performance, i.e., it distinguishes between the best and poorer performers. The Uniform Guidelines define three acceptable types of validity studies. If a selection procedure meets the validity requirements of the Uniform Guidelines, it means that the procedure can be used to predict future job success, i.e., to identify the best-qualified candidates.

CURRENT STATUS OF THE UNIFORM GUIDELINES

A 2001 symposium in the *Review of Public Personnel Administration* questions why the 1978 Uniform Guidelines have never been updated, despite advances in psychology, the passage of the Civil Rights Act of 1991, and the evolution of case law during the 1980s and 1990s. The EEOC initiatives to revise the Guidelines in the mid-1980s failed in light of opposition in

Congress and the Reagan administration. One of the symposium authors, Christopher Daniel, argues persuasively that the Guidelines have become a lightning rod in the controversies over affirmative action and preferential treatment for minorities. Although the Guidelines are in critical need of an overhaul, it is almost certain that political considerations would intervene.

Daniel concludes, “Revising the Guidelines would probably require a presidential administration’s active support. Attention would need to be devoted to the matter, controversy would be endured, and expenditure of some “political capital” would be required. It is unusual for presidential administrations to sacrifice simply to make regulations more useful to managers and test developers. Therefore, the Guidelines may never change.”^[4]

Unit Determination

Jonathan P. West

Department of Political Science, University of Miami, Coral Gables, Florida, U.S.A.

INTRODUCTION

A bargaining unit decision necessarily precedes labor-management collective bargaining, because it helps to determine with whom the employer must deal in negotiations. Specifically, it is the process of grouping certain jobs and employees for the purpose of representation. Statutory requirements, administrative agency decisions, union and employer agreement, an arbitrator, or, less frequently, the courts can determine bargaining units. At the federal level, where 2218 labor union bargaining units exist, the Federal Labor Relations Authority (FLRA) makes such determinations. In the private sector, the National Labor Relations Board (NLRB) sets standards for determination of the bargaining unit. At the state level, it is often the Public Employee Relations Boards (PERBs) that make these decisions.

The process of unit determination and certification of an exclusive bargaining agent typically involves five steps. These include filing a petition for a representation election, “showing” by the union that a certain percent (e.g., 30%) of workers in the unit prefer representation, validating the petition at a hearing, designating the unit by administrative action, and certifying the unit.^[1]

Unit determination is important, because the composition and size of the unit may affect bargaining success. The composition of the bargaining unit influences not only the parties who engage in negotiations, but also the types of demands and concessions made in negotiations and the rules affecting employee work and supervisory actions. Depending on the nature of the bargaining unit, it might be easy or difficult to gain majority support, recognition, or certification as the exclusive bargaining agent for employees. Unit determination also affects the scope of topics considered in negotiations as well as the probability of successful dispute resolution, contract ratification, and contract administration. If the bargaining unit is of limited size and scope, the range of topics subject to negotiation will be similarly restricted. If the unit lacks cohesion, it will reduce its leverage in negotiations and its ability to implement the contract.^[2,3]

SIZE AND COMPOSITION OF THE BARGAINING UNIT

It is not uncommon for employers and unions to differ over the size and nature of the bargaining unit. From the employer’s perspective, large units are often preferred. This is because it facilitates cost efficiencies when a single agreement is negotiated with a standard package rather than multiple separate bargaining contracts, each with its own unique provisions. A proliferation of units involves more negotiating sessions, heightens the probability of disruption, and adds complexity of multiple working rules and personnel practices. Employers may believe that smaller units increase the likelihood that perverse union tactics may be used, including end runs (circumventing management negotiators by going over their heads to elected officials or outside parties), leapfrogging (unions seeking bargaining gains greater than those achieved by other unions), and whipsaw bargaining (gains by one union used to justify benefits for another).^[4]

Employees, by contrast, usually favor small units. Smaller, more homogeneous units maximize opportunities for employee participation, may better reflect the needs and objectives of union members, amplify their voting power, foster greater solidarity, and are easier to organize. Larger units with more diverse constituencies add to the difficulty of fairly representing all employees’ interests (specialized interests might be ignored in larger units) and can become fractionalized, further complicating ratification and implementation of agreements. However, in certain situations, these concerns may be overridden by an employee organization’s desire to increase its leverage with management and maximize the numbers of eligible employees for the unit.^[1–3,5]

There are strategic considerations that influence the calculations of employers and employees regarding unit size. The union will often support a unit that it feels most capable of organizing. Those employers who are resistant to collective bargaining would likely prefer a unit that the union would have difficulty winning. If collective bargaining is inevitable, management may support larger units, because it can capitalize on

disagreements within the employee group (divide and conquer) to gain a bargaining advantage. When competing unions are simultaneously seeking recognition for a group of workers, they will each seek to define the unit—a narrow versus broad configuration—in ways that reflect their organization's strength.^[2] In other words, all parties are seeking their strategic advantage in the crucial decision of unit determination.

A unit determination decision is not only potentially contentious but also complicated. This is because the criteria or standards used in making unit determinations are vague and subject to multiple interpretations, despite considerable guidance from diverse sources. Employees, employers, and the public may differ in their perceptions of what constitutes an “appropriate” bargaining unit. The issue can confront a labor relations agency on different procedural matters, including certification or initial organization (no previous history of collective negotiations), decertification or severance (a preexisting unit with a splinter group wishing to bargain separately), accretion (a preexisting unit absorbing a new group of employees into the employer), or unit clarification (inclusion of a new or changed job in a preexisting unit).^[2]

CRITERIA FOR UNIT DETERMINATION

The criteria used to determine the composition of the bargaining unit usually conforms to NLRB guidelines. While there is variation in criteria among the states, they typically include the following:

- **Community of interest**—This is determined by several factors, including common duties, conditions of employment, skills, kinds of work, job classifications, career ladders, geographic location, and supervision.
- **Bargaining history**—This alludes to prior labor-management relations in the jurisdiction, including patterns of cooperation, negotiation, and representation. If there is a prior history of bargaining, it is likely that the preexisting structure will continue.
- **Unit size**—The unit needs to be large enough to facilitate effective bargaining and to avoid proliferation of small units that are costly for government, distracting to negotiating parties, and time consuming.
- **Effective dealings and efficiency of operations**—This seeks to avoid creation of units that are incompatible with administrative groupings and disruptive to existing human resource policies and practices.
- **Exclusion of supervisory or confidential employees**—This factor assumes that supervisors are more appropriately grouped with management

and should not be allowed to bargain with rank-and-file employees.^[6]

The most common standard used is “community of interest.” But, this term is ambiguous and subject to different interpretations. It can refer to commonalities within occupational groupings (similar work rules), within departments (same personnel practices and work environment), within functional units (common wage and benefit structure), and within the competitive service (uniform regulations). Community of interest can also be used to group employees with a common status or skill (e.g., profession), with distinctive characteristics identified by public policy (e.g., supervisor exclusion), and with a common pattern or history of bargaining (e.g., a workable relationship).^[2]

The community of interest criterion to be considered in unit determination is often specified in statutes with terminology such as “geographical location,” “avoidance of fragmentation,” “need for efficient administration,” “recommendations of the parties,” “requirements of standardization,” “desires of the employees,” “extent of employee organization,” and so forth. Some of these terms would likely lead to units that cross departmental lines (e.g., requirements of standardization), others suggest grouping workers at the same work site (geographic location), and still others allude to units attuned to the needs of employers (avoidance of fragmentation) or employees (extent of employee organization).^[7]

In forming bargaining units, different standards may apply. For example, a distinction is sometimes made between an “appropriate unit” and “the most appropriate unit.” The NLRB originated the “appropriate unit” test, and certain states use it as well. The “appropriate unit” standard can result in unit proliferation, but it leaves more discretion to employees in forming their own units based on community of interest and ease of organization. Where the “most appropriate unit” standard to represent community of interest is applied, it leads to a smaller number of units for employers to deal with, while reducing discretion of employees to choose groupings and complicating unions’ efforts to organize and win representation elections.^[7]

UNIT DETERMINATION AND SUPERVISORS

In the public sector, unlike the private sector, the decision of whether to exclude supervisors from a bargaining unit can be confusing. In the private sector, a federal statute and government agency defines “supervisor” and makes determinations about whether a job qualifies as supervisory. Supervisory jobs are then excluded from the bargaining unit. In the public sector,

where such distinctions are less clear cut, different jurisdictions handle the issue in different ways. Thus, the issue of whether to include supervisors in the same unit with non-supervisory personnel is a recurring one in the public sector. As Nigro and Nigro pointed out, three separate questions are involved regarding the status of supervisors and unit determination: Is the position in question really supervisory in nature? Is it desirable to create units composed of supervisors and non-supervisors? Should supervisors be allowed to form their own units?^[8] Regarding the first question, certain state laws make the distinction between bona fide supervisors (excluded from the bargaining unit) and less-than-bona fide supervisors (permitted in the employee unit), but even here, these distinctions are difficult to make, and there is considerable variation among the states on whom to include or exclude. At the federal level, supervisors who exercise considerable discretion in hiring, directing, rewarding, or disciplining employees are excluded.^[9]

The desirability of grouping supervisors and non-supervisors in the same bargaining unit is a subject of dispute as well. Generally, unions support a policy of inclusion, because they are interested in expanding the scope of union membership; employers, by contrast, may want supervisory personnel excluded because of their managerial responsibilities.^[5] An example highlights the problem: In a public university, should a department chair be included in the bargaining unit with the faculty? This issue has been hotly debated, because on the one hand, the department chair is a faculty colleague; on the other, the chair is a representative of management. This issue has typically been resolved in favor of including the department head in the faculty unit, while excluding other administrators such as president, vice president, or dean, but there is variation among the states on this matter.^[10]

This issue arises in other educational and departmental settings as well. For example, in secondary schools, should the principal be placed in a unit with the teaching faculty? In police and fire departments, it is not uncommon to find bargaining units that include all personnel except the chief. This can lead to conflicts of interest when grievances are filed, because the grieving employee and the supervisor may be part of the same bargaining unit. This puts the steward in a difficult position, because the steward's role is to represent everyone in the unit, in this case, both parties to the dispute.^[11] The supervisor

also faces a dilemma when belonging to the same unions as a subordinate and has to exercise supervisory responsibility (e.g., discipline) over these subordinates in the bargaining unit.^[12]

Disagreements also surface over whether supervisors should be permitted to form their own bargaining units. Absent such permission, supervisors may feel disadvantaged vis-à-vis others who have bargaining rights and, thus, greater leverage to pursue their interests. However, those who oppose separate units argue that supervisors should identify more with management, and they fear that supervisors would instead align with organized labor in workplace disputes.^[8]

United States Treasury Securities

Theo Edwin Maloy

*Department of History and Political Science, West Texas A&M University,
Canyon, Texas, U.S.A.*

INTRODUCTION

Among the many duties of the United States Department of Treasury is managing government accounts and the public debt.^[1] The department's Bureau of the Public Debt borrows the money needed to operate the federal government by issuing and servicing marketable, savings, and special securities.

The Bureau of the Public Debt evolved from the Register of the Treasury, becoming the Public Debt Service in 1919. It was designated as a bureau in 1940. With the passage of the Government Securities Act in 1986, the bureau assumed the rulemaking authority for the government securities market. The bureau's functions include the following:

- Borrowing the money necessary to operate the federal government, and accounting for the resulting public debt;
- Receiving, storing, issuing, and redeeming government securities;
- Servicing registered accounts and paying interest when due;
- Maintaining accounting and audit control over public debt transactions and publishing statements;
- Processing claims for securities that are lost, stolen, or destroyed;
- Promoting the sale and retention of United States Savings Bonds.^[2]

DEBT INSTRUMENTS

Treasury securities are debt instruments. They are issued to raise the money needed to operate the federal government and to pay off maturing debt obligations. Currently, individuals, corporations, state or local governments, foreign governments, and other entities outside of the United States Government hold just less than US\$4 trillion in United States Government debt. Government trust funds, revolving funds, and special funds hold just less than US\$3 trillion in United States Government debt, including Federal Financing Bank securities. Treasury securities are a safe and secure investment because the full faith and credit of the United States Government guarantee that interest and

principal payments will be paid on time. Interest on Treasury securities is exempt from state and local income taxes.^[3–5]

Most Treasury securities are “liquid,” which means that they can easily be sold for cash at the prevailing price in a “secondary market”—a public double-auction market where buyers continually offer securities for sale and sellers continually offer to buy those securities. As a group, Treasury securities are often called “marketable Treasury securities,” “Treasury securities,” or “Treasuries.” Individually, they are sometimes called “T-bills,” “T-notes,” and “T-bonds.”^[6]

OWNERSHIP OF DEBT INSTRUMENTS

The algebraic sum of all accumulated United States deficits and surpluses is popularly known as the “federal debt.” Beginning in 1918, Congress has set a limit on the total dollar amount of debt securities that the Treasury can have outstanding. The current “debt ceiling” is US\$7.38 trillion, raised in May 2003 from US\$6.4 trillion. Congress may have to increase the debt limit when the federal budget is in surplus on a unified budget accounting basis; the unified budget surplus or deficit only reflects the government's transactions with the public. The debt limit includes Treasury borrowing by government trust funds as well as borrowing by the public.^[7]

The current federal debt is approaching US\$7 trillion at a rate of increase of approximately US\$1.5 billion/day. Foreign and international individuals and institutions hold in excess of US\$1.5 trillion of the US\$4 trillion in government securities held by entities outside of the United States Government. As the supply of government securities increases, foreign and international holdings of government securities increase at an approximately 22% year⁻¹ rate.^[8] Asians hold 55% of foreign investments in Treasury securities, and the buying continues. Since the financial crisis of 1997 and 1998, Asian economies have rebounded, in part, by using cheap currencies to boost exports to the United States. In a search for stable investments, the region's central banks have invested trade surpluses in dollar-based securities, primarily United States bonds. In addition, the central banks have sold their currencies for dollars

to maintain the weak currency advantage. Many of the dollars, too, are invested in United States securities. Although the buying supports the United States securities markets, international selling—and rumors of selling—has a detrimental effect on American markets. However, the foreign central banks' large holdings of United States Treasury securities are difficult to sell. If large amounts of securities are sold, the value of the banks' remaining securities also declines.^[9]

TYPES OF SECURITIES AND THEIR OWNERSHIP

The Bureau of the Public Debt sells Treasury bills, notes, and savings bonds to individual investors. The buyer lends money to the United States Government, and receives the payment of interest in exchange for the loan. Treasury bills and notes are sold in increments of US\$1000, with a minimum purchase of US\$1000.

All Treasury bills and notes are issued and held by an entry in an electronic ledger, called the “book-entry form.” An investor can hold Treasury securities in one of two systems: Treasury Direct or the commercial book-entry system. The security's owner has a direct relationship with the Treasury in the Treasury Direct system. The commercial book-entry system is an indirect holding system where a financial institution, government securities broker, or dealer holds the record of the security for the owner. The commercial book-entry system is a multilevel arrangement that involves the Treasury, the Federal Reserve System (acting as the Treasury's agent), banks, brokers, dealers, and other financial institutions.

Treasury Direct makes principal and interest payments by direct deposit to the security holder's bank account and sends statements to the holder. The Treasury charges no fees for opening an account or buying securities, but it charges a maintenance fee for accounts holding securities with par values in excess of US\$100,000. Treasury Direct allows security holders to automatically reinvest the proceeds from most maturing securities.

In the commercial book-entry system, the security investor maintains a relationship with a financial institution, broker, or dealer, and potentially pays fees for its services. The institution will receive the security owner's principal and interest payments from the government. The commercial book-entry system allows an investor to easily buy and sell securities, as well as—unlike Treasury Direct—to use them for collateral. An investor can also hold Treasury securities in stripped form—known as STRIPS or zero-coupon treasuries—in the commercial book-entry system.

STRIPS are Treasury securities that do not make periodic interest payments. Market participants create

STRIPS by separating the interest and principal parts of a Treasury note or bond. For example, a 10-year Treasury note consists of 20 interest payments—one every 6 months for 10 years—and a principal payment payable at maturity. When the security is “stripped,” each of the 20 interest payments and the principal payment becomes separate securities and can be held and transferred separately. STRIPS can only be bought and sold through a financial institution, broker, or dealer, and held in the commercial book-entry system.

To sell a security held in the commercial book-entry system, the holder arranges a sale through a financial institution, government securities dealer, broker, or investment advisor. Normally, there is a fee for this service. If the investor holds a security in Treasury Direct, it can be transferred to an account in the commercial book-entry system, or it can be sold through the Treasury's Sell Direct program for a fee. Securities can be transferred between Treasury Direct and the commercial book-entry system.^[5]

The Treasury Department has not offered a Treasury bond because of the decision in October 2001 to suspend the issuance of 30-year bonds. Bonds issued with coupon rates above current market interest rates are periodically called for early redemption.^[10] The Treasury sold non-callable 30-year bonds on February 15 and August 15, and may have subsequently issued an additional amount of a bond at a “reopening.” The 30-year bond was the “benchmark” for all debt instruments. Until February 1985, the Treasury issued fixed-principal bonds that are callable 5 years prior to maturity. After providing 4 months' notice, the Treasury can call any callable bond on its first call date, or on any semiannual interest payment date thereafter. The callable bond with the longest remaining period to maturity is the 11.75% bond of November 15, 2009–2014, which was issued in November 1984.^[11]

TREASURY BILLS

Treasury bills, or T-bills, are securities that mature in 1 year or less from their issue date. T-bills are bought for a price less than their face value, called the “par value.” T-bills can be issued for any period of time less than 1 year, but 28-day, 91-day, and 182-day T-bills are most prevalent. When the T-bill matures, the Treasury pays the purchaser the par value. The interest is the difference between the security's purchase price and what the Treasury pays the owner at maturity. If a T-bill were sold before it matures, a buyer in the open market would pay the seller an amount including the accrued interest. There is an active secondary market for T-bills.

The Treasury usually auctions 13-week and 26-week bills every Monday and a 4-week bill on Tuesdays, for

issue on Thursday of that week. It also issues cash management bills from time to time for periods as short as 1 day to maintain the Treasury cash balance, especially immediately before regular tax payment dates.^[12]

Although T-bills pay interest, they are sold at a “discount rate.” If a 91-day US\$1000 Treasury bill were bought at a 0.840% discount, it would be purchased for US\$99.788 per US\$100 of face value. The discount for a 91-day US\$1000 T-bill with a 0.840% discount can be approximated at:

$$2.123 = \text{US } 1000(\text{discount rate}) \\ (\text{days to maturity}/360)$$

The discount rate is not the investment rate, sometimes called the “bond equivalent yield.” For a 91-day US\$1000 Treasury bill bought at a 0.840% discount, bond equivalent yield can be approximated at:

$$0.008535 = (365 \times \text{discount rate})/[360 \\ - (\text{discount rate} \times \text{days to maturity})]$$

The Treasury’s Recent Treasury Bill Auction Results lists term, issue date, maturity date, discount rate, investment rate, price per hundred, and the T-bill’s Committee on Uniform Securities Identification Procedures (CUSIP) number. A 91-day T-bill with a 0.840 discount would be listed with a 0.854 investment rate and a US\$99.788 price per US\$100 of face value.^[13]

TREASURY NOTES AND BONDS

Treasury notes and bonds are securities that pay a fixed rate of interest every 6 months until the security matures, when the holder receives the par (or face) value. The only difference between a Treasury note and a Treasury bond is their time until maturity. Treasury notes mature in more than a year, but not more than 10 years from their issue date. Bonds, when they are issued, mature in more than 10 years from their issue date. Notes and bonds are usually originally offered at a price close to their par value.

Currently, the Treasury sells fixed-principal and inflation-indexed notes. Both pay interests twice a year, but the principal value of inflation-indexed securities is adjusted to reflect inflation as measured by the Consumer Price Index (the Bureau of Labor Statistics Consumer Price Index for All Urban Consumers). With inflation-indexed notes and bonds, the semiannual interest payments and maturity payment are based on the inflation-adjusted principal value of the security.

The Treasury issues 2-year notes at the end of each month, and 3-year, 5-year, and 10-year notes are issued on February 15, May 15, August 15, and November 15

of each year. The Treasury reopens 5-year notes on the 15th day of the month after each original issue. An offering is usually announced 1 week before the auction.^[14]

BUYING MARKETABLE TREASURY SECURITIES

Treasury bills, notes, and bonds can be purchased in a Treasury auction, or in the securities market. If an investor wants to buy a Treasury security at an auction, the buyer contacts the Treasury, a Federal Reserve Bank, a financial institution, or a government securities broker or dealer. If the buyer wants to buy a Treasury security in the securities market, the investor contacts a financial institution, broker, or dealer.

Each Treasury bill, note, or bond is sold at a public auction. In the Treasury’s auctions, all successful bidders are awarded securities at the same price, which is the price equal to the highest rate or yield of the competitive bids that are accepted. A complete explanation of the auction process is published in the Uniform Offering Circular, which is in the Code of Federal Regulations at 31 CFR Part 356. About 1 week before each auction, the Treasury issues a press release announcing the security being sold, the amount being sold, the auction date, and other pertinent information.

For each security that the investor wants to buy, a bid is submitted. The investor can either bid non-competitively or competitively, but not both in the same auction. A non-competitive bid receives the full amount of the security that the buyer wants at the return determined at that auction. An individual cannot bid for more than US\$1 million in a bill auction, or US\$5 million in a note auction. Most individual investors bid non-competitively. A competitive bid specifies a “rate” for bills, or the “yield” for notes. If the return that the bidder specifies is too high, the investor might not receive any securities, or just a portion of what is sought. However, competitive bids can be much larger than non-competitive bids. Bids can be submitted directly to the Treasury, to a Federal Reserve Bank, or through a financial institution, broker, or dealer. Bids are accepted by mail. Current customers can submit bids via the Internet, or by touch-tone telephone. A financial institution, government securities broker, or dealer can also submit bids on an individual’s behalf, probably for a fee.

UNITED STATES SAVINGS BONDS

Savings bonds are Treasury securities that are payable only to the person to whom they are registered. They are not transferable in a secondary market. Savings bonds can earn interest for up to 30 years, but they

can be cashed after 6 months if purchased before February 1, 2003; or after 12 months if purchased on or after February 1, 2003.

Series EE and Series E bonds and savings notes are “accrual securities” where the interest is periodically added to the amount the buyer originally paid, to establish their current redemption value. When a buyer cashes a Series EE bond, a Series E bond, or a savings note, the owner receives the redemption value, which is the return of the original investment plus the interest that was earned as the bond was held. The Series EE savings bond increases in value until it is cashed or reaches final maturity in 30 years. The “double E” is the successor to the Series E bond that was issued from May 1941 to June 1980. Investors can purchase up to US\$30,000 in Series EE bonds each calendar year.

The amount printed on a Series EE is its denomination, also known as its face amount. Eight denominations are available: US\$50, 75, 100, 200, 500, 1000, 5000, and 10,000. The US\$50 and 75 denominations are not available through Payroll Savings Plans and other employer thrift plans. Because bonds accrue interest for up to 30 years, the bond’s redemption value can exceed its face value. Since December 2001, Series EE bonds have been inscribed as “Patriot Bonds” as part of the country’s antiterrorism effort.^[15–17]

Series HH and Series H bonds are current-income securities issued with face values of US\$500, 1000, 5000, or 10,000. The redemption value of the bonds remains constant at the amount the buyer invested, and the interest is paid to the holder every 6 months. When the owner cashes a Series HH or Series H bond, the original investment is returned. There is no limit on how much a person can invest in Series HH bonds.^[17,18]

Series I bonds are a new type of accrual security bond designed for investors seeking to protect the purchasing power of their investment and earn a guaranteed real rate of return. Series I bonds are sold at face values of US\$50, 70, 100, 200, 500, 1000, 5000, and 10,000, and they grow in value with inflation-indexed earnings for up to 30 years. An investor can purchase up to US\$30,000 in Series I bonds during a calendar year. The bonds offer a fixed rate combined with semiannual inflation adjustments to help protect purchasing power. The fixed rate of return is announced by the Treasury Department each May and November. The fixed rate of return announced in May is the same over the entire life of the Series I bonds purchased between May 1 and October 31 of that year. The fixed rate of return announced in November applies to the entire life of Series I bonds purchased between November 1 and April 30 of the following year. The semiannual inflation rate is also announced each May and November by the Treasury Department. The semiannual inflation rate is based on changes in the Consumer Price Index. The semiannual

inflation rate announced in May is a measure of inflation over the preceding October through March. The inflation rate announced in November is a measure of inflation over the preceding April through September. The semiannual inflation rate is combined with the fixed rate of a Series I bond to determine the Series I bond’s earnings rate for the next 6 months. Series I bonds increase in value each month, and interest is compounded semiannually. They earn interest for up to 30 years. In the unlikely event that the Consumer Price Index is negative, the value of Series I bonds would remain the same until the inflation rate becomes greater than zero. In addition to earnings being exempt from state and local income taxes, Series I bonds’ federal income taxes can be deferred for up to 30 years, until redemption or other taxable disposition. Taxpayers who qualify can exclude all or part of Series I bonds’ interest from income as long as the proceeds are used to pay for tuition and fees at eligible post-secondary educational institutions.

Two types of savings bonds can be bought for cash—the Series EE bonds and the Series I bond. Series HH bonds can only be bought in exchange for Series EE, Series E, and savings notes, or when the owner reinvests the proceeds of matured Series H bonds.^[19]

OTHER SECURITIES

Government Account Series securities are issued because various government trust fund statutes provide for interest-earning investments of money that is not needed immediately for the purposes of the fund. Growth in the trust funds is attributable to returns on these investments and current contributions to the funds. Interest rates on par-value Government Account Series securities are prescribed in statutes that provide the investment authority for government trust funds, which include the Social Security trust funds, the Civil Service Retirement and Disability Fund, the Federal Hospital Insurance Trust Fund, and the Federal Retirement Thrift Savings Fund (G Fund). Generally, the Treasury pays interest semiannually on par-value Government Account Series securities. The G Fund invests in overnight par-value securities, and interest is compounded each day. Similar, the Treasury started to issue market-based securities in 1974 to provide an investment mechanism within the government for federal accounts that are authorized to invest in securities that are issued or fully guaranteed as to principal and interest by the United States. These accounts, which number over 200, include retirement fund assets managed by the Pension Benefit Guarantee Corporation, Federal Housing Administration mortgage insurance funds, and the Bank Insurance Fund. The statutes of federal agencies and funds that invest in market-based

securities authorize investments but do not authorize investing in par-value Government Account Series securities.^[20]

The Treasury sells State and Local Government Series securities to issuers of federally tax-exempt securities as an investment for the gross proceeds of a tax-exempt issue, or any other amount that assists the state or local government to comply with provisions of the Internal Revenue Code related to the tax exemption. The book-entry securities are not transferable. The purchaser can designate the interest rate on a time deposit security, but the rate cannot exceed the maximum interest rate. The maximum rates are “five basis points” (five one-hundredths of 1%, or 0.0005) below the current Treasury borrowing rate for a Treasury security of comparable maturity. The interest rate for a time deposit security that matures in more than 30 years, up to and including 40 years, is the maximum rate on a 30-year State and Local Government Series security. The interest rate for demand deposit securities is a variable rate that the Treasury calculates by using the investment yield on 13-week Treasury bills in the most recent weekly auction, adjusted by the estimated marginal tax rate of investors in tax-exempt securities and adjusted for Treasury administrative costs. Interest is added to the principal and is reinvested daily until redemption.^[21]

The Treasury has issued dollar-denominated Foreign Government Series securities directly to foreign governments since 1962. It has also issued foreign currency-denominated foreign series securities on several occasions between 1961 and 1980, but none of them remains outstanding. Special operations, mostly involving United States Government loans to foreign countries for military purchases in the United States, necessitate dollar-denominated securities as temporary investments for the borrowed funds. The Treasury also issued long-term zero-coupon securities to foreign governments on several occasions between 1988 and 1994 to assist them in restructuring their obligations under the Brady Plans. The proceeds of the zero-coupon securities were pledged to pay the principal amount of bonds issued by the foreign governments.^[22]

Domestic Series securities were issued in 1989 as an investment for Refcorp under the Federal Home Loan Bank Act. Proceeds of the 30-year and 40-year zero-coupon bonds were pledged to pay the principal amount of marketable Refcorp bonds. The Treasury has not issued Domestic Series securities to another entity.^[23]

The Federal Financing Bank is a government corporation, created by Congress in 1973, under the general supervision of the Secretary of the United States Treasury, established to centralize and reduce the cost of federal and federally assisted borrowings from the public. The bank aids federal agencies and other borrowers whose debt is guaranteed by the federal

government. The Federal Financing Bank was also established to deal with federal budget management problems that occurred when offbudget financing flooded the government securities market with offers of a variety of government-backed securities that competed with Treasury securities. The bank has the authority to purchase any obligation issued, sold, or guaranteed by a federal agency to ensure that fully guaranteed obligations are financed most efficiently.^[24]

Other miscellaneous federal debts exist, including Adjusted Service Bonds from World War I and Armed Forces Leave Bonds from World War II.^[25]

CONCLUSION

Federal government yearly deficits result from expenditures exceeding revenues. The Treasury borrows money to finance the accumulated deficit. In an effort to increase demand for government debt instrument, the Treasury offers a variety of debt types and maturities. As financial markets develop and mature, the Treasury will create new debt instruments to make U.S. government debt more attractive to domestic and foreign investors and governments.

Urban Planning and Ethics

Carlos Nunes Silva

Department of Geography, Faculdade de Letras, University of Lisbon, Lisbon, Portugal

INTRODUCTION

Urban and regional planning faces complex ethical dilemmas related to public interest; professional integrity; obligations toward the community, clients, employers, and colleagues; intellectual property; as well as the environment, other forms of life, and future generations, both in strategic and daily decisions. Therefore, besides the fact that they have to obey and implement the law, the mission of planning professionals includes complex judgements over conflicting land uses, which makes this one of the areas in public administration and public policy where decisions are embedded in highly complex, multilayer, and multi-actor decision-making processes. A planner often has to weigh personal values against those established in one's professional organization, or in the society. In spite of this, the discussion of ethical principles in urban and regional planning is a relatively recent fact, even in countries where the planning profession has been organized for a long time.

THE RISE OF ETHICS IN THE PLANNING PROFESSION

The pioneering studies of Howe and Kaufman^[1,2] on planners' values and ethics showed that planners acted differently according to their values and ethical principles, but, contrary to what could be expected from these results, the issue was not on top of the agenda in planning theory discussions at that time. Notwithstanding the fact that planners commonly did not acknowledge explicitly that they were considering ethical principles (e.g., when planning new land uses), they were in fact reasoning usually as consequentialists (or utilitarians), weighing the "good" and the "bad" of the outcomes of their decisions through planning techniques such as cost-benefit analysis. That planning has been guided somehow by values seems to be a fact throughout the history of urban planning, at least in its utopian proposals.

But only in the last two decades has a clear interest in the ethical dimension of planning been developed as a result of different factors, as numerous authors such as Kaufman,^[3-5] Khakee and Dahlgren,^[6] and Hendler^[7] show. First, it is a consequence of the conviction that

the allocation of different land uses is an ethical problem, in the sense that decisions about land use have economic, social, cultural, and environmental consequences. Second, the emergence of new visions of planning, in reaction to the then-dominant "rational planning model," led to the recognition that decisions about land use are not value-neutral; it is through the political process that some groups or individuals gain and others lose, according to their power resources. This interest in the political dimension of planning was further reinforced by the theory of justice by Rawls^[8] and the justification for the minimal state by Nozick,^[9] which together helped the development of a strong interest in the ethical dimension of planning in the late 1970s onward. In fact, unlike many other professions, planning involves choices on key social facets of collective life. For example, planners have to decide what are good or bad public spaces, or on housing estate characteristics, or on a transport solution. Thus they need to know how to decide among different claims, taking into consideration multiple and contradictory dimensions. Third, the growing number of professionals in this field increased the social relevance of this activity, further augmented by a more demanding citizenship. Fourth, the social impact of incorrect professional behaviors forced professional organizations to make explicit ethical guidelines in the form of codes of conduct. Finally, the increasing relation between the public sector and the private sector, as a consequence of the liberal economic policies after the 1970s, challenged traditional public administration values and legal control procedures. This and the conviction that different people in the same service can behave differently encouraged governments and international organizations dealing with public policy to adopt ethical standards.^a

The adoption of codes of ethics in planning, if centered on human rights and on the environment, is

^aFor example, for a brief review of measures proposed in Organization for Economic Cooperation and Development (OECD) countries, refer to Refs.^[10-12]. For the kind of measures proposed by the United Nations for the public sector, in general, refer to Refs.^[13,14]. For a similar review in the case of local government, refer to Ref.^[15]. See also the Organization of American States for its anti-corruption measures and the World Bank's "Code of Professional Ethics."

commonly seen as having practical relevance. It not only facilitates the resolution of moral problems which professional planners face, but is seen also as a self-regulation reference for professional conduct; it helps to find an ideal for the profession, states the profession core values, and reinforces the profession's status in society; it informs employers, clients, and the population, in general, about the kind of responsibilities and obligations a planner has toward them; it helps to create an environment of fairness in which ethical conduct will be the norm, as the works of Kaufman,^[3-5] Hendler,^[16,17] and Lawton^[18] suggest. Additionally, it is widely believed that professional behavior is conditioned by the organization's ethical environment and the ethical culture of that specific group. Therefore, to have an ethical code of professional conduct, explicit moral norms is seen as a positive factor for the definition and prevention of unacceptable behavior. Indeed, if a certain professional conduct is seen as unacceptable, then it will be less probable that it will be practiced by many members.

Codes of professional ethics in planning are relatively recent, even in countries where the discussion of ethical principles inside professional organizations has a long-standing tradition, as Kaufman,^[3-5] Mahoney,^[19] and Fisher^[20] point out. Notwithstanding, there are several examples of professional organizations related to planning that adopted codes of conduct long ago, although usually with only very general guidelines. For example, in 1914, the American Society of Civil Engineers (ASCE) adopted a code of ethics (www.asce.org), amended several times afterward. In 1924, the International City-County Management Association (ICMA) adopted a Code of Ethics that was subsequently revised on several occasions. The Town Planning Institute in the United Kingdom (www.rtpi.org.uk) adopted in the 1930s a code of professional conduct. The predecessor of the American Institute of Certified Planners (AICP) (www.planning.org/aicp), the American Institute of Planners (AIP), adopted a code of ethics and professional conduct in 1971, which was revised in 1978 by the new AICP and subsequently revised again in 1981. The American Planning Association (APA) (www.planning.org) adopted a "Statement of Ethical Principles" in 1987 as a guide for all its members, replacing the 1962 code of the preceding organization, the American Society of Planning Officials (ASPO). In 1992, the APA adopted a "Statement of Ethical Principles in Planning" to serve as a guide of ethical conduct for all those involved in the planning process.^[3,21] In Canada, in 1994, the Canadian Institute of Planners adopted also a code of conduct for its members (www.cip-icu.ca).

In Europe, the European Council of Town Planners (ECTP) in 1985 adopted guidelines for professional conduct to be developed by each national association

of planners in each member country.^[22] In the European Union (EU), there were additional reasons for the harmonization of professional codes related to the increased labor mobility in the EU market—a situation that affected several professional groups related to urban and regional planning; this led the ECTP to recognize the need for some sort of deontological harmonization within Europe (www.ceu-ectp.org).

A similar process toward the adoption of professional codes of conduct by planners can be found in many other countries around the globe such as, for example, Australia (www.planning.org.au), New Zealand (www.nzplanning.co.nz), India (www.itpindia.org), Brazil (www.arquitetofna.org.br), and South Africa (www.saplanners.org.za).

Other professional groups involved in urban and regional planning also adopted codes of professional conduct in the same period, such as Landscape Architecture (www.asla.org), Architects (www.aia.org/), Civil Engineer (www.asce.org), Geographers (www.aag.org), Sociologists (www.asanet.org), among others. Most of these codes deal with issues of professional conduct but say little about the major aims of planning. A search of North American professional organizations in other fields of activity also shows that the 1990s was a period during which most of them revised their previous code of ethics and professional conduct,^b which were initially adopted, in most cases, in the 1970s or 1980s. This means that we are talking of a practice that—in most professions related to urban and regional planning—has been in effect for only around three decades.

But probably the situation in all these professional organizations in the early years of professional ethics codification was not much different from the one described by Kaufman^[3] and related to the AICP case: "While some American planners were probably aware that their respective planning organizations adopted ethics codes in the 1980s, few probably knew what was in these codes. This is not meant as a criticism of planners because codes tend to be exceedingly dry and uninspiring documents to read." But since then, the situation seems to be changing. Indeed, since the 1980s, the subject of planning ethics has been introduced in several graduate planning programs in the United States, Europe, and other parts of the world, including a discussion on how best to teach planning ethics. At the same time, numerous empirical studies

^bFor example, that was the case of the American Historical Association, in 1990; American Evaluation Association, in 1994; Archaeological Institute of America, in 1994; American Mathematical Society, in 1995; American Psychological Association, in 1997; American Society of Landscape Architecture, in 1998; and American Statistical Association, in 1999.

of the ethics of planners were performed and the results were published, as a consequence of the growing concern with the political and ethical dimensions of planning as Kaufman,^[4,5] Klosterman,^[23] and Hendler^[7] point out. It also became common to find seminars dedicated to these topics in programs of professional planning conferences and congresses, as well as special training sessions organized by planners' professional associations.

Despite planning professionals' general acceptance of ethic codes, they often also are seen as an unsatisfactory set of recommendations—vague and paternalistic, and based on a naive view of planning theory and on a simplistic conception of power relations, as Lucy^[24] and Fisher^[20] argue. As planning is a multidisciplinary field and a multiactor activity, having a code of conduct specific for planners risks ignoring other key stakeholders' concerns and impacts. This view argues for a more comprehensive approach to professional ethics codification. On the other side, the code's effectiveness depends on several conditions not always practiced by all professional organizations. Examples include the implementation of ethics education programs, hotlines for reporting wrongdoings, adoption of a legal framework to support ethical standards, and concomitant appropriate sanctions to deal with misconduct.

ETHICAL PRINCIPLES APPLIED IN PLANNING

There are two main groups of ethical perspectives to be considered in urban planning. The first group includes the consequentialist and deontological perspectives, and the second includes the anthropocentric and non-anthropocentric perspectives.^{[25,26]c} If both dimensions are combined simultaneously, then four major categories of perspectives can be considered.

For the consequentialist perspective, it is the outcome of an action or behavior that determines if it is correct or not, or if it is "good" or "bad." Utilitarianism is an example of the consequentialist perspective. On the contrary, deontological theories see any action or behavior as having a value in itself, independently of its consequences. An ethical urban and regional planning has to consider and contrast ends-oriented ethics (consequentialist ethics) with means-oriented ethical principles (deontological ethics), as both sets

of principles are morally relevant in addressing dilemmas faced by urban and regional planners.

A second dimension is related to the importance given to *Homo sapiens* in the definition of the moral community. For anthropocentric perspectives, only *H. sapiens* matter for that purpose; whereas for non-anthropocentric perspectives, other forms of life and the environment are also valued independently of the importance they have for human beings.

Therefore the professional practices of planners can be rather different from each other depending on the ethical perspective adopted, as research works by Howe and Kaufman,^[1,2] Khakee and Dahlgren,^[6] and others showed.

From a deontological and non-anthropocentric perspective, for example, ethical urban and regional planning seeks to maximize the public interest, without compromising other moral duties in relation to other forms of life, the environment, and future generations. Therefore it should seek to create a more just society and to improve redistributive justice among individuals, groups, and territories, following the theory of justice and communitarian perspectives by Rawls, but at the same time care about the impact on the environment.^[31] This can be performed through the choices made for the provision of housing, education, culture, employment, and health facilities, for example. Thus planning should protect the interests of the disadvantaged (disabled, aged, children, women, and minorities). Planning proposals should respect basic human rights, including the right to a minimum of social benefits available to all, irrespective of economic capacity, and should also prevent harm to people or communities and the environment. Deep Ecology, first proposed by Aarne Naess, is one example of a deontological and non-anthropocentric perspective relevant to the discussion of urban planning ethics.^[32]

Whatever the ethical perspective adopted, planners face three main sets of ethical dilemmas. One is related to individual rights, with the tensions between freedom and autonomy on one side, and governmental regulations on the other. The second is related to the overall society, with the tensions, for example, between economic efficiency and social justice. The third relates to the environment and the conflicts between, for instance, environmental protection and development.

The first one (planning and individual rights) has to do, for example, with the preservation of the characteristics of the locality and the choice of lifestyles, with paternalism in planning decisions and the need to prevent or minimize damages, or with limits imposed on private propriety.^[26,33] In fact, in urban planning decision-making processes, there are frequently controversies regarding the location of certain activities, or about certain local characteristics (landscape beauty, architectural styles, etc.), or about the limits

^cRefer to Ref.^[27] for a review of classical texts (Jeremy Bentham, John Stuart Mill, etc.), as well as contemporary expressions of consequentialism (Richard Brandt and Robert Adams, etc.); for a discussion of utilitarianism, see, among others, Refs.^[28,29]. Refer to Ref.^[30] for a review of classical texts on deontology (Immanuel Kant, W. D. Ross, etc.) and also its contemporary expressions (Robert Nozick, Thomas Nagel, Stephen Darwall, etc.).

imposed on owners of private properties. Urban growth controls, such as building restrictions that stimulate higher prices, can be seen in some cases as an instrument to protect the character of an area by reducing the ability of low-income families to move in. This and community opposition to the location of poor families, homeless, mentally disabled, or ethnic minorities in the neighborhood are two examples of the social forces that a planner has to face and balance, and which can directly affect individual rights. The balance between national security and individual liberties is also becoming an important ethical issue for planners, in part related to the increasing use of electronic surveillance device in public spaces.

Some planners consider it acceptable and desirable to preserve certain characteristics of the community and to restrict land use, new buildings, or reconstruction of old ones; this requires sensitivity to place identity. Other planners maintain that, if there are no strong arguments such as public health or security reasons, people should be left free to carry out their own choices.^d However, the argument for the protection of local characteristics should not imply the creation of a monolithic community; therefore urban planning should facilitate the multiple lifestyles that may exist. Moreover, a fair and equitable public participation procedure should always be put in practice to ensure equal opportunities for all interests to be considered. Such procedures may include the use of a local referendum, but this is an uncommon practice.

The possibility of damages on third parties caused by individual decisions, such as those resulting from conflicting land uses, is another type of situation that justifies public intervention and concomitant restrictions on property rights.^e If some of the negative consequences created by private actions cannot be avoided, it is important, according to this perspective, to seek compensation for such damages from those that caused them.

Restrictions and benefits imposed by a plan zoning on private property need to be balanced fairly. In this case, it is commonly considered correct to apply a system of transfer of development rights from new development areas to compensate owners not being allowed to build, or owners allowed to build less than average, and also to compensate owners of rural land as a form of compensation for the preservation of agricultural and forest lands.

The second group of ethical dilemmas has to do with the social responsibility of planners. In fact, it can be argued from a deontological perspective that planners also have redistributive obligations toward different social groups if we take, for instance, Rawls' contractarian theory of justice. Urban planning should seek to reduce economic and social inequalities through maximization of benefits for the most disadvantaged social groups. From a deontological perspective, ethical urban and regional planning achieves the maximum well being for the majority of citizens, which means that the utilitarian dimension of a plan has to be conditioned by other moral obligations (such as those related with certain human rights) as part of the social contract. Therefore there is a moral obligation for the content of an urban plan to maximize the net benefits for the most discriminated or oppressed in society.^[26,35,36] A planner who values children, the aged, the disabled, or women, for instance, will certainly design urban environments that are different from those who do not, or will not endorse or approve developments that do not meet these criteria.

From this point of view, planners also have ethical obligations in relation to future generations,^f especially due to the fact that few professions have a greater influence on the human habitat and on the quality of people's life. Therefore they should consider the cumulative impact of their decisions and prevent the destruction of built or natural patrimony, and avoid, when possible, all decisions with irreversible consequences. From this perspective, planners have a moral obligation to keep children and young people at the center of planning options, as they will be the generation that will receive the consequences of today's decisions. Nevertheless, there are arguments against the existence of obligations to future generations on the part of planners.

Finally, a third category of ethical dilemmas faced by planners is related to the environment and urban sustainability. In an irreversibly and increasingly urban world, professional planners have a moral obligation to plan for a sustainable city, which cannot be achieved without social equity and social inclusion, and is an additional reason for urban planning to be redistributive.^[37] For this, it is necessary to incorporate new values and a different relationship with nature. Such an aim requires a shift in the dominant urban sprawl model of development toward a more compact city—a condition to achieve sustainability.^g Because part of

^dA classical reference for this point of view is Ref.^[34].

^eThat is the case of the so-called NIMBY (Not In My Back Yard) or LULU (Local Unwanted Land Uses) type of land use conflicts. A socially responsible planner has a moral obligation to overcome these practices and to promote inclusive communities, reversing the NIMBY to a YIMBY attitude (Yes In My Back Yard).

^fSee Rawl's just saving principle; refer to Ref.^[8].

^gWe consider here the following widely used definition of sustainable development: "Development that meets the needs of the present without compromising the ability of future generations to meet their own needs."

biodiversity loss is due to pollution, destruction of natural habitats, and other man-created conditions, it is necessary to integrate development with conservation. But defining sustainable development in that way seems not enough. Indeed, as Cafaro^[38] argues, “massive biodiversity loss is sustainable, provided future generations can meet their self-defined needs.” Therefore, from a non-anthropocentric and deontological perspective, planners have a moral obligation to protect and preserve the environment for *H. sapiens* and also for other forms of life in this generation and in future generations.^[26,39] These contradictory aims that planners have to address between environmental protection and development are but one more example of the ethical dilemmas that these professionals have to deal with in their daily decisions.

From a deontological perspective, it can be argued that communities have a right to live in a clean environment, which means that there is an ethical duty for planners to minimize the ecological footprint of cities and to promote a model of urban development contrary to urban sprawl. In this model, urban development is more compact, with priority for the redevelopment of brownfield zones instead of occupation of new natural areas, which should only be urbanized when there is no alternative. Therefore it is necessary to develop new ethics for the built environment; reduce urban sprawl associated with the use of individual cars; promote more compact urban patterns, through increase of urban densities and mixing of activities; and create a city that is both safer and easily accessible on foot, as the “New Urbanism” movement claims in its statement of principles.^[40] If initially and for most people these ethical obligations for the promotion of an eco-friendly urban and regional development had essentially an anthropocentric justification, they now need to be seen also in relation to other forms of life, thereby enlarging the moral community. Partially related to this is also an ethical duty to coordinate with nearby local or regional authorities and to estimate the impact of local decisions on neighboring administrative areas—a situation that calls for and justifies planning at metropolitan or regional scales.

In planning procedures from a deontological perspective, every citizen has the right to be treated fairly and with equity in the planning process, which means equal treatment by the plan for those in the same condition and the inclusion of those for whom a plan is being prepared. Nonetheless, this sometimes can be an unfair process because of the unequal power relations of those involved in the participation process. In practice, an ethical process of public participation in planning requires that those in a more unfavorable social condition be able to make themselves heard in the decision-making process, as the concept and practice of “advocacy planning,” proposed by Paul

Davidoff in the 1960s, tried to introduce into mainstream planning. Planners, like other professionals, not only should take into consideration the interests of all stakeholders, but also have an obligation of professional integrity; therefore they should not take personal gains from the decision-making process.

CONCLUSION

Whether dealing with inner-city processes or with natural areas, urban and regional planning inevitably faces conflicting interests and values. The idea of a value-neutral and rationalist planner is no longer a consensual description of mainstream professionals in this field. New ethics concerned with human rights and social justice, and with a deeper green consciousness emerged gradually in the planning profession worldwide in the last two decades. This new ethics replaced the traditional utilitarian and anthropocentric type of criteria in land-use decisions. Like other domains of public policy, urban and regional planning faces a wide range of values, often in conflict with each other. As a result, the task of deciding in practice what is wrong and right is a rather difficult enterprise. In recognition of this complexity and diversity of issues, planners’ professional organizations and schools of planning all over the world have been promoting the integration of ethics into their activities and teaching programs since the 1980s. If a driving idea emerges from discussions on these issues, it is certainly that ethics should guide urban and regional planning aimed at restoring the equilibrium of the natural, social, and built environments by reducing the ecological footprints of cities and making them more livable and inclusive places for the present and future generations, with due consideration for human and non-human forms of life and ecosystems.

Use and Management of Information Technology in State Government

Paul M. Chalekian

Department of Political Science, University of Nevada, Reno, Carson City, Nevada, U.S.A.

INTRODUCTION

The effective use and management of information technology (IT) is a major goal of every state. Almost all forms of government use some aspect of IT. Even within the most remote and rudimentary functions, attempts are made to try and improve efficiency. Personal computers are a standard tool and the use of spreadsheets is a common practice. As the numbers of Internet users increase, electronic government (e-government) portals have been developed as a way to reach those users. In terms of management, information resources must be cost effective at a time when calls for fiscal accountability are pervasive. Various forms of governance exist, resulting in debates about whether or not to centralize a state's IT resources. Unless otherwise noted, the references used will be about practices among the 50 American states. However, for many of the following concepts, the wider political term "state" could be interchanged. Although many variations in the use and management of IT exist, some common patterns of governance have been identified.

Max Weber's essay on "Bureaucracy" delineated elements of ideal-type organizations, and among these is a system of files.^[1] But unlike Weber's era, remote and complex organizations access those files, usually over a network. A database is a well-organized collection of files. Because of advances in communication technologies, it is common for an agency's database to reside in another bureau. A data warehouse is a collection of data which may originate from files or databases in one or more locations. Many feel that data warehouses should be managed by an information resource management (IRM) organization and those organizations often take on that role. Before describing more complex organizational structures, a historical perspective is in order.

HISTORY

Because of each bureaucracy's file continuity requirement, the evolution of IT in a state can be understood from a historical perspective. At the end of the 1960s, 90% of all data processing systems were supported in nine major areas: finance, revenue, highways, motor

vehicles, employment security, health and welfare, law enforcement, legislative and institutional functions.^[2] Unless a reorganization of agency functions occurred, the original location of file-related services tended to prevail. This was the case even more so within the largest state agency functions listed above. Recently, however, the portability of files has greatly increased the creation of options.

Similar to centralized purchasing and mail services, a type of "Holding Company" was envisioned by Gulick^[3] and these have often materialized among the states in the form of central data processing bureaus. For control purposes, the greater the role of a top executive in decision making, the greater the degree of centralization.^[4] In agencies late in adopting IT practices, their first system may have been developed as part of a controlled project. If developed within a central data processing bureau, staff are often trained to become highly specialized and their managers were anxious to expand the agency's client base. At the same time, the administrators of the slower adopting agencies may have sought out workload services from a central data processing organization.

Currently, the use of centralized agencies among the states is common; however, many bureaus procured and developed their own IT operations and support staff. Over time, the size of the files became less important, but the factors that influence control of the files became more so. When mini- and microcomputers appeared in increasing numbers, the centralization/decentralization debate radically changed.^[5] Because of lower equipment start-up costs, these systems could be more easily justified and procured; however, the ongoing expenses of having stand-alone systems were not always delineated. Whether or not an agency is highly networked, specialized staff are often needed to maintain their systems. As such, financing and cost recovery factors will be included in the state patterns described below.

SINGLE AUTONOMOUS AGENCIES

Ernest Alexander, in his book entitled *How Organizations Act Together*, identified *Single*, *Lead* and

Coordinating types of agencies.^[6] This is not to say that *Single* agencies are not networked or that other pooled structures cannot exist. Alexander's categories are useful in describing the current types of IT arrangements. In this modern era, few agencies are without interoperability with others; however, in functions involving specialized applications, encoded communications, or proprietary vendor arrangements, agencies often develop, maintain, and enhance their own computer resources.

Specialized applications within a state, such as voting, legislative, judicial or medical systems, are just a few examples of systems that usually retain separateness from other agencies. These autonomous agencies often have their own computing resources due to legislation or the unique nature of their specialized function. In an attempt to provide customer service, most have provided Internet and credit card interfaces. Agencies with more file intensive functions may also make kiosk or interactive voice response systems available to their customers.

Encoded communication requirements often separate law enforcement and other technology specific agencies. These requirements have increased even more in the post-9/11 world. In some instances, extensive connectivity requirements may be in place, utilizing advanced encryption schemes. As a result of these special security requirements, state law enforcement agencies are often the primary host for this integration function. As a primary point of contact for the federal government, the enforcement entities often act as a coordinator for local jurisdictions.

Proprietary vendor arrangements may also restrict whether the files of an agency can be hosted by another. Often developed in the private sector or by outsourcing, these systems, to name a few, may include the functions of corrections, health care, recreational reservations or gaming. Based on a vendor's contractual arrangement, the computer source code for manipulating a system may be restricted or denied. These functions may also have their own revenue sources or accounting systems.

Once procured, agencies that host their own computer systems must continually scrutinize their operating expenses. They must have the ability to obtain adequate funding for their specialized equipment, software, and staff. Whether these applications are specialized, encryption based, or originate from a proprietary vendor, automated interfaces to the state's accounting system may have to be established if the autonomous agency does not have an accounting system of its own. Staffing is a large expenditure. Recruiting IT specialists can be a challenge for many state bureaus. Positions may have an actual IT classification, or the autonomous agency may require their workers to do IT tasks while within a

non-IT professional classification. These later conditions often prevail as many individuals perform crucial IT functions along with their other agency duties.

Within these networked but autonomous agencies, IT governance can be delicate and complex. Usually a high level steering committee is formed containing members of the single agency's administrative staff. Typically a steering committee is chaired by the top IT representative, although the priority-making tasks usually originate from outside the realm of IT with each member of the committee trying to advance his/her functionality. A specialized project may detract from the development of an agency's enterprise framework, and this may prove critical for future compatibility. Meanwhile, the need to implement new legislation prevails.

The development of an entity's IT framework puts the group in a unique situation. For instance, Henry Mintzberg has identified individuals and/or groups as part of a separate support staff, existing outside the basic flow of work. He indicated the presence of a separate technostructure group, one task of which is to help organizations adapt to their environment.^[7] Within a single autonomous agency, it is possible that this technostructure may be developed internally, or private sector and/or outsourcing alternatives may be explored.

CENTRALIZED STORAGE

Diverging slightly from the single autonomous pattern, many organizations are increasingly dependent upon one another for information. Upon closer examination, some additional models have evolved as one agency structure may host the primary files of others. For instance, interfaces are often established to link agencies with similar functions, making common data available to share. Centralization may be caused by a crisis^[7] and a centralized bureau may pick up a client agency if it has lost critical data. Whether or not to centralize the processing of data has been a long standing debate^[5,8] and the pattern of centralization is elaborated upon below.

Rather than having each agency administer its own IT contracts and equipment, the centralized IRM form of organization may be used. In the 1960s and 1970s, its primary function was just to support and host other client agency data. Central data processing services are most likely to be under departments of Administrative Services or General Services departments.^[9] Similar to Gulick's "Holding Company," these agencies are equipped to provide centralized data processing storage and services. Programmers and other highly

specialized individuals are often staffed and controlled by the centralized bureau. They have a limited knowledge of client agency functions, so they often concentrate solely on supplying computer resources.

As opposed to agencies that have their own systems, computing economies of scale can often be obtained with many agencies storing their data on a single large system. Various types of charge-back arrangements are in place whereby the centralized bureau can get revenues from services rendered, as well as recovering the direct costs associated with storing client bureau files. For these centralized entities, the dominant organizational units were found to involve data processing operations, telecommunications, and policy and planning.^[10] With regard to the first two, they represent direct costs and can often be charged back directly to the client agencies. Operations are usually staffed for 24-hr operations, and specialized systems programmers are available in an emergency. With the third, policy and planning aspects are often considered indirect costs and are associated more with discretionary expenses.

Previously, James Thompson has described technologies as being *Long-linked*, *Intensive* or *Mediating* varieties. The last of these can serve as a broad example for the remaining descriptions. A *Mediating* technology is a form in which clients or customers "...are or wish to be interdependent."^[11] From a central bureau' perspective, all client agencies are anticipated to be serviced equally; however, contingencies and priorities soon become apparent and well known to even entry level computer operators. Among Alexander' categories, centralized storage agencies represent *Lead* organizations, charged with, or assuming "...the responsibility of coordinating the other organizations in the network."^[6] Because of these interorganizational issues and the computing risks associated with down time, more elaborate forms of computing governance have evolved.

CENTRALIZED COORDINATION

For those who utilize centralized IT services, complex dependencies can develop. Thus the hosting agency becomes a *Mediating* organization in accordance with Thompson^[11] and a *Coordinating* type of agency based on the descriptions of Alexander.^[6] The first and most likely place to find a policy and planning entity for IRM is under the state comptroller, finance, budget or treasury departments, with the second most likely place being under the chief executive' office.^[9] The authority of these agencies may start out with simply the oversight of standards, but it may progress into

project management services or large scale software development.

As in any state entity, the success of planning and project management is crucial. With less than optimal planning, the computing resource requirements of a single agency may slow the transaction processing statewide. Project management experience is usually more commensurate among the staff of a centralized agency. Typically they have participated in many more projects and utilized a greater variety of computing software and resources. Expertise in project management methodologies, such as the system development lifecycle, may be gained from the central IRM staff. However, if the resources between the agencies become scarce, a form of mediation among the agencies involved needs to occur while their priorities are deliberated and established.

Some states hold the files in an agency as a way of storage management, some develop and coordinate policy and standards for IT, and some do both.^[12] As such, the funding structures become more complex, the more the centralized agency takes on. A proprietary internal service fund type of accounting may be used. Direct computing costs, as well as the less quantifiable indirect costs, are often elements of client agency bills. Due to federal uniformity requirements, all agencies need to be billed in a consistent way. For an agency less dependent upon federal funding, this could fuel a desire to break away from the storage agreement with the centralized IT agency and become autonomous.

As an example of a cost-saving measure, the centralized IRM bureau may have approval authority for statewide IT hardware acquisitions. Being so empowered, the staff attempt to standardize procurement to increase the likelihood that purchases are more compatible with the state' computing framework. These standards are often set based upon what the centralized bureau' staff can adequately support. For instance, the amount of available expertise in a given programming language may influence the decision to endorse one software provider over another. Further, these decisions may be imposed upon client agencies. The licensing for software is often costly and so statewide discounts are often sought. The overall goal of these IRM agencies is to save costs and to develop and maintain employees who are specialized and can maintain systems and associated files.

To administer these complex bureaus, a cabinet level position is often required. A Chief Information Officer (CIO) is the person with the responsibility, authority and accountability for IRM in a state.^[12] These individuals are usually a senior executive and have a high degree of technical expertise. States with a CIO structure have performed well,^[13] but

sometimes this authority and responsibility is deemed too great for a single individual. As such, an Information Resource Management Commission may have authority. An IRM Commission refers to formal boards, commissions, committees or authorities established for the purpose of "...directing or managing the planning and implementation of information processing resources, policies, standards and services within the state."^[12] With such a wide scope, various user committees may be involved with the management of client agencies. As such, the setting of standards and priorities may be part of a committee's responsibilities. Committees may also be appointed by administrative officials from outside the centralized IT bureau. Some common committee functions may include those pertaining to security, strategic planning, project oversight, networking and communications, law enforcement, enterprise architecture, or employee development.

The coordination of Internet activities has extended the scope of many centralized bureaus. All of the American states route their Internet services through a single portal. In this way, one or more firewalls or other security measures can be invoked. This also forces state agencies to standardize, knowing that their clients' inquiries may originate from within the same site. Thus, a centralized pattern of frameworks, from state to state, has prevailed. The majority of constituents are able to access these sites for simple agency forms and information. More advanced applications are becoming increasingly available for the more file intensive functions.

CONCLUSIONS

Unlike Max Weber's era, 50 different configurations are used in the structure of American state government. In one study, it was determined that IRM cannot and should not be limited to a single model.^[10] It has been said that even in uncentralized systems, such as the Internet, at least some mutually agreed upon standards are needed.^[14] In their political environments, IT services must be efficient and effective so that agency clients find their services easy to use. From their state home pages, links to the executive branch agencies and other political subdivisions are often standardized and available. As indicated earlier, the financial struggles continue as client agencies seek to reduce their costs while the centralized bureau seeks to retain control. For every agency that pulls its files and services away from the hosting bureau, the costs may increase for those remaining.

Some close to practitioners of IT have said that centralization and decentralization is cyclical.^[15]

The need for economies of scale in state government often leads to a centralization debate. Once away from centralized support, the specialization of IT employees becomes increasingly necessary. The posting of static web pages may be simple, but the development of more sophisticated services, involving disparate files, is more complex. Only by planning and a careful analysis of requirements can the systems of a state be successful. The ability for any agency to train and retain project managers and specialized staff is an ongoing challenge. Adequate funding and fiscal control may allow for specific functions of a state's IT to continue, and the services provided must be continually evaluated. The importance of files and their integrity will continue to be a vital and vibrant issue for years to come.

Using Econometric Models for Public-Sector Decision Making

Richard G. Sims

*Director of Tax Policy, Institute of Taxation and Economic Policy,
Washington, District of Columbia, U.S.A.*

INTRODUCTION

The analysis of public-sector decisions involves consideration of the consequences that are likely to result from the decisions. The point of decision making, after all, is to affect the future. The more informed decision makers are regarding the consequences of their actions, the more likely they are to make decisions that achieve their intended objectives. Because policy decisions at the state and local levels frequently involve economic matters, analysts often turn to economic models for assistance. Models can help predict the likely path of the economy, forecast revenues and expenditures, or depict the regional economy as it might appear if a proposed policy is enacted.

An economic model is, by definition, a simplified description of economic reality. Simplification focuses attention only on the economic relationships that produce meaningful observations about the policy question at hand. This article addresses economic models that are useful when the issue of concern relates to state and local public policy decisions. Such models may be developed in-house or be acquired “off-the-shelf,” and may be relatively simple or highly complex. Policy models often start as input–output models but are enhanced to take into consideration an array of factors that improve their forecasting ability and their usefulness in depicting the results of policy changes. Models that address geographic or political areas smaller than the national economy are referred to as regional models. The selection of a particular model and its enhancements will depend on the unique requirements of the respective decision-making environment; the user’s taste, preferences, and abilities; and the organization’s resource constraints.

In any case, there are certain attributes and relationships that the model should contain and operational characteristics that the user should bear in mind. Models that incorporate interindustry economic linkages and fundamental economic principles (rising prices lead to lower quantity demanded, etc.) are particularly useful and are sometimes referred to as “well-described” economic models. Well-described economic models perform two important functions: 1) they produce results that are useful in making decisions; and

2) they provide a framework for thinking about and understanding the economy. A well-described model may be viewed as a tool that depicts many of the complex interactions in an economy, although it may not include all of the aspects that an informed observer might be aware of. In this sense, the model serves as an organizing tool that provides a structure for the user to generate a clear, logical, and internally consistent picture of the regional economy and of various alternative futures.

Among the primary uses of economic models for state and local public policy decision making involve forecasting economic activity; analyzing tax and spending measures; and analyzing economic development proposals. Other uses include analyzing changes in business, environmental, or employment regulations; the local consequences of changes in national policy; and changes in energy policy or prices. A model can be used to aid policy makers in developing and evaluating alternative futures for the state or local economy. This article is intended to provide public-policy professionals with a better understanding of how economic models work and an appreciation how such models can be used to improve public decision making. What follows is an overview of some of the main functions of economic models when used to address some of the more common state and local government economic issues.

FORECASTING

Policy questions are, by their nature, about influencing the future, and consequently, policy practitioners are often asked to provide forecasts of economic activity. Such forecasts may be accomplished by simply projecting recent trends into the future using, for example, simple projections or linear regressions. This approach may produce satisfactory results over a relatively short time frame in a relatively stable economic environment. However, this simplistic one-variable model assumes nothing other than population matters and explains little. A simple mathematical expression that states that the demand for public services (p.s.) is

\$1000 for each person in the population,

$$\text{p.s.} = \$1,000 \times (\text{POP})$$

constitutes a model and could be useful in giving a rough approximation of the costs of providing services. The opportunity costs of using this economical approach are as follows: 1) reduced forecast reliability, particularly over long periods of time or in dynamic periods; and 2) the loss of an opportunity to increase the understanding of the local economy. Neither cost is trivial. A small improvement in forecast accuracy can make the difference between a budget surplus and having to raise taxes and cut public programs. An increased understanding of the regional economy can lead to improved decision making with resulting improvements in the efficiency of public policies and their effectiveness in achieving the intended policy goals.

A first step in improving forecast accuracy beyond projecting the trends in the variables themselves involves adding consideration of outside influences on the regional^a economy. Because the economies of even the largest states or even multistate areas are influenced heavily by trends in the broad general economy, forecasters typically start with forecasts about the larger national economy developed “exogenously,” i.e., outside the regional model. This forecast of the national economy becomes the “driver” for the regional model.^b The regional economic activity associated with changes or trends in the broader economy is then estimated in the model. For example, forecasts of changes in the gross domestic product, national employment, and income trends are viewed as among the forces that propel regional output, employment, and income.

To be more reliable as a predictive and explanatory tool, a model should capture the dynamic structure of the real economy. That is, it should incorporate feedback responses depicting the reactions that occur throughout the economy when a policy or economic variable changes. For example, an increase in demand for locally manufactured auto parts 1) pushes up regional income and wages, 2) attracts new workers into the area, 3) increases the demand for local housing, and 4) raises the cost of production of other regionally manufactured goods. Each of these affected sectors, in turn, has their own linkages and produces their own impacts. The forecast thus becomes a statistical projection based on historic regional trends *plus* explicit consideration of major outside trends affecting

the local economy *plus* consideration of the dynamic influences of basic economic fundamentals.

Regional models may be constructed in ways that the variables they address are regional (recognizing, of course, that regional variables implicitly incorporate national trends), or they may present a full array of regional and national variables. A regional model is usually sufficient when comparing local policy options, considering local or regional initiatives, or evaluating exogenous events that affect only the region. A more robust model that allows the user to directly control regional and national economic variables can address the effects of a national policy on the region or can explore the regional effects of alternative national forecasts.

Though similar in structure, regional and national models have certain intrinsic differences. Consider, for example, interest rates, which are one of the most significant factors affecting economic activity. At the national level, the monetary system is endogenous. The reactions of the Federal Reserve to changes in the unemployment rate and the resulting consequences for inflation are directly related to the national economy and should be explicitly considered in a national model. The model containing multi-year features could allow an interest-rate response to be incorporated into the model to return the economy to its control path after a period of adjustment to a policy stimulus. Regional economies, on the other hand, are open systems, where money flows freely from one area to another at a common interest rate. There is no regional monetary policy.

TAX AND EXPENDITURE ANALYSIS

State and local governments regularly confront decisions that have direct and indirect economic consequences for the region and individuals they represent. Decisions relating to the tax system and to government spending have the potential to influence economic activity. Taxes, such as income taxes, sales taxes, business taxes, and property taxes, impact the economy, though each has distinct and operationally different effects. The ability to distinguish these differences enhances a model's accuracy and utility. Models can be used to address additional tax and expenditure issues such as distributional impacts and balanced budget requirements.

Individual Income Taxes

Individual income taxes reduce purchasing power by directly reducing a consumer's disposable income. An increase in income tax rates will slow economic activity

^aThe term “regional” is used herein to mean any subnational economic unit, whether city, county, or state, or other units.

^bA national forecast, in turn, will have incorporated the international economy within its findings.

and cause the collections of consumer spending-related taxes, such as sales taxes, to decline. Over the long term, an income tax increase will slow inward population migration by reducing workers' disposable income. In addition, because the economic base has declined, each percentage point of nominal tax will produce less revenue as tax rates rise. Some income tax proposals, such as those that apply only to the top marginal rates, for example, may require an independent estimate of the tax base to which the rate change is applied. Significantly, the ultimate burden (the incidence) of an individual income tax increase falls almost exclusively on income earned within the region (i.e., there is no burden shifting).

Sales Taxes

A sales tax increase affects the economy as if it were an increase in the price of locally purchased goods and, consequently, a reduction in income available for spending on other goods. A significant feature of the sales tax is that for some regions, such as tourist destinations or regional trade centers, a substantial portion of the total sales tax burden may shift to visitors to the area, therefore, raising revenue for area services which is not paid by area residents. Alternatively, for less fortunate tax jurisdictions, particularly those that may be located near other jurisdictions with significant trade competition, an increase in a sales tax rate may produce a substantial shift in consumer spending to those surrounding jurisdictions. Over the longer term, sales tax increases deter inward migration by widening the gap between nominal personal and real disposable income. A highly specified economic model that takes the price elasticity of sales within the specific region into consideration can be extremely useful in accessing sales tax impacts.

Business Taxes

The effect of a change in a business tax is to change the implicit rental cost of capital. Raising a business tax makes capital relatively more expensive, lowering the number of potential projects that would meet a given investment criteria and reducing investment in the region. In addition, for new and existing projects, business taxes raise their local production cost relative to other regions. To appropriately depict these features requires consideration of various macroeconomic features, such as capital and labor substitution and import and export substitution, as well as multiyear considerations to address business tax features, such as accelerated depreciation or capital investment credits, which change the timing and size of business decisions. Businesses also pay a portion of the general taxes of

a region, such as sales taxes and property taxes, and business employment cost may rise when an increase in individual income taxes cause firms to have to pay more to attract or retain workers. The returns to ownership of business are typically assumed to be widely distributed, and therefore, regional personal income is not directly reduced by business taxes. These considerations can be built into the model to improve its ability to describe the real economy.

Property Taxes

Local governments, in particular, are often concerned about the effect of property taxes. In most regions of the United States, property taxes are left to local governments to fund local services, especially public schools. Property taxes affect the cost of capital and consumer purchasing power. Capital-intensive businesses, such as auto dealerships or petroleum refineries, are particularly sensitive to property tax rate changes. For individuals, the cost of home ownership rises, leaving less money available for spending on non-housing items. Modeling a property tax change requires converting the exogenously obtained estimate of the dollar amount of the property tax change into a capital cost change. An estimate of the share of the tax change that is directly paid by homeowners is used to reduce household disposable income and, therefore, consumer spending on other items. The dollar amount of the change and the share paid by households is generally obtained from the official property tax authorities, because their data will reflect the actual base to which the rate change will be applied and might differ from the base obtained from secondary sources. The burden of property taxes falls initially on property owners, though part of the burden is ultimately shifted to renters and consumers, depending on the respective elasticities.

DISTRIBUTIONAL IMPACTS

Policy makers are often concerned with the distributional impacts of tax changes. The effect of a tax change on households of various income levels might be estimated by applying the results of a tax revenue simulation, which typically presents results in a fairly broad aggregate form (i.e., a change in total personal income), to a distribution model that shows household spending at various levels of income, for example. Satellite models of household spending can be developed from Consumer Expenditure Survey (CES) data, for example, to analyze the impact of sales tax changes by household income. Income tax and other tax distributional models can be developed using data from

sources such as state revenue departments, the Internal Revenue Service (particularly, the *Statistics on Income* bulletin), the U.S. Bureau of Census, the Bureau of Economic Analysis, Bureau of Labor Statistics, and County Business Patterns. The CES data present a matrix of household spending by income category. This matrix can then be reviewed to identify the specific items that would be subject to the sales tax.

THE TAX-AND-SPEND AXIOM

This axiom is the state and local government finance equivalent of Sir Isaac Newton's famous axiom that "for every action there is an equal and opposite reaction." Namely, that for every tax dollar collected, there is a dollar of public spending; and its flip-side corollary, that for every dollar increase in government spending, there is a dollar increase in taxes. This axiom follows directly from the fact that state and local governments generally require some form of balanced budgets, implying that they must spend what they take in and may only spend what they take in.^c Consequently, a dollar taken out of consumer spending in the form of taxes does not simply disappear into a desk drawer in the treasury or into an economic black hole, where money goes in but nothing comes out. Rather, a dollar of tax is transformed into a dollar of government spending. Similarly, each dollar of government spending is not a gratuitous event but must ultimately be paid for by taxes, which should be accounted for in a comprehensive analysis.

Considering only the effects of changes in taxes would show, unsurprisingly, that tax increases have negative economic impacts, because, by themselves, taxes represent a cost increase and a reduction of disposable income. Conversely, all proposed public expenditure projects would show positive economic impacts, if only the benefits of the projects are considered, and their costs in terms of taxes are ignored. Ignoring either side of the tax-and-spend equation would be comparable to a business evaluating the benefits of a new piece of equipment without asking the cost, or deciding to raise the price of its product by a large amount without considering the broader consequences of the decision. In the real world of public-policy analysis, it is not unusual for a policy proposal, such as a plan to cut taxes or a program involving public spending, to refer to only one side or the other

of the tax-and-spend equation. A tax cut may be proposed with no specific reference to the spending measures to be reduced as a consequence, or a government project will be proposed with no reference to the source of its funding. Even when the full ramifications are not specified in the proposal, the analyst should bear in mind that these consequences exist and should be addressed in some appropriate manner. To ignore either side of the tax-and-spend equation is to, in effect, advocate for one side or the other of the proposal. If a proposed tax cut is proposed and specifies no particular expenditure cuts, an analyst might, for example, use an "across-the-board" reduction in existing programs. A proposed new program with no specific funding might be matched with an "across-the-board" tax increase, or a proportionate reduction in all other programs.

The caveat is that the tax-and-spend axiom may appear to be avoided, at least temporarily, by the issuance of debt. Debt allows current spending to exceed current revenues by allowing the expenditure payments to be spread over future time periods. Debt financing is accounted for in a model by considering the discounted net present value of the stream of debt service payments. The full implications of debt financing should be specified in the analysis.

A final point on expenditures is that the *composition* of government spending is economically important and should be specified as clearly as possible. Some components of government spending, such as elementary education, are relatively labor intensive and regionally acquired, producing relatively high local employment impact from government effect. Other components, such as technology and scientific equipment, tend to be capital intensive and to be produced outside the region. Often, a government spending program will involve more than one facet to consider. Highway spending, for example, may contain a construction-related component, producing construction jobs and income, and a transportation cost reduction component, lowering regional business costs and increasing transportation productivity in the region. Similarly, education spending is a source of jobs for teachers, administrators, cooks, and other support personnel; a source of increased labor productivity in the region; and an attractive amenity luring business and people to the community. Spending on corrections, the fastest-growing component of most state government budgets, is a producer of local jobs but does little to improve the economic climate of the region.

ECONOMIC DEVELOPMENT PROPOSALS

Policy analysts are often called upon to proclaim on the impact of a proposed new manufacturing plant,

^cThis is radically different from the federal government, where spending and revenues seldom balance. In fact, the difference between the two is the basis for national fiscal policy, where spending intentionally exceeds taxes in times of slow economic growth, and taxes may be set at a level above spending when the economy is "overheated."

sports coliseum, or tourist attraction. Economic models are often used to predict the direct and indirect effects of a new activity on the economy of the region and are sometimes used in the development or evaluation of “incentive packages” used to attract targeted new projects. The direct effects of a project are typically straightforward and readily identifiable. In general, the project will be known to entail X millions of dollars in construction spending over a certain period of years and directly employ Y number of workers when completed, with an annual payroll of Z . A project will also have indirect effects, or linkages, to the local economy, i.e., the “multiplier effect.” To obtain these indirect effects, the model estimates the share of demand for the particular project inputs that will be supplied by existing local producers. The direct and indirect effects add new household income that is spent locally and is referred to as the “induced effect.” Each of the effects adds to local economic activity and the local tax base and represents the benefits of the project.

Local multiplier effects are typically quite small relative to state-level effects, which in turn, are quite small relative to national-level effects. The larger the economic unit, the more likely that inputs will be supplied from firms located within the unit. The locally supplied input share, sometimes referred to as the Regional Purchase Coefficient or Locally Supplied Inputs, is obtained by looking first at the input matrix for the new project and then at the existing array of local suppliers to identify potential local suppliers. Determinations must then be made regarding the likely proportion of the new project’s total demand for inputs that will be satisfied by these local suppliers. An algorithm to address industry-specific considerations, such as supplier capacity relative to project demand and historical shipping patterns, can be used for this purpose. For relatively small economic units, the estimation of the expected locally supplied inputs can be exceptionally difficult. In a relatively large economy with a large number of firms in the potential supplier pool, the likelihood of one or more of them supplying the required inputs is fairly high. At the local (say, county) level, it is not unusual to have only one, if any, supplier of certain required inputs, and that potential supplier may face capacity constraints, be a dedicated supplier to an existing firm, or not produce the specific type or quality product demanded by the new facility. While a large supplier pool would tend to average these firm-specific difficulties, in local-level analysis, firm-specific knowledge is extremely beneficial.

In some cases, growth in one industry may, as part of its indirect effects, come at the expense of other existing industries. A new casino, for example, may reduce the demand for existing local restaurants and other non-casino recreation activities. A new

manufacturing plant, in another case, might drive up prevailing wages, crowding out some existing industries and making investment in other industries less profitable. In addition, economic development projects generally necessitate some (often considerable) new public expenditures for roads, sewer and water lines, public protection, education, and so forth. To accurately assess a new activity, it is essential to carefully identify all aspects of the proposal, explicit and implied. New, large projects are often given incentives in the form of grants, tax credits, and exemptions, which directly reduce the net benefits that would otherwise be attributable to the project. If the public expenditures for the facility plus the general support cost for new project-related residents exceed new project-related revenues, then other taxes must be increased or other government spending must be reduced.

A new project coming into an area typically meets its employment needs by paying wages that are at least marginally above the prevailing wages being paid in the area for similar labor. This increase in demand stimulates an in-migration to the area of job-seekers and their families, which, in turn, places new demand on public services—schools, streets, police and fire protection, and so forth. The costs of providing these added public services offsets some of the public revenue gains from new development.

BUSINESS, EMPLOYMENT, AND ENVIRONMENTAL REGULATIONS

State and local governments frequently become involved with issues of business regulation, employment regulation, and environmental protection. Business regulations might take the form of limits on the types and size of new industry coming into the area, the imposition of fees and user charges for certain activities, or certain mandatory investments in order to engage in particular businesses. Environmental protection regulations may involve requirements such as land set-asides, the provision of certain amenities, or the compulsory installation of pollution-abating equipment or techniques. Employment regulations may involve limits on hours individual employees may work, the payment of a statutory prevailing wage that may exceed the actual community wage, and minimum wage requirements for low-income workers.

Much of the required information for evaluating regulations, such as the direct cost of pollution-abatement equipment or the share of the workforce that would be affected by changes in the local minimum wage, would be obtained outside the model. The effects of environmental regulations, in particular, are often subtle and require careful analysis of the specific regulation under consideration. The economic impacts of regulatory

changes can usually be determined by careful and explicit consideration of direct impacts in terms of their economic fundamentals (increase in cost of capital, increased employment costs, lowered demand for labor, etc.) then following the economic implications of these changes.

REGIONAL IMPACTS OF CHANGES IN NATIONAL POLICY OR CONDITIONS

Changes in national policy or economic conditions can influence the regional economy as part of their effect on the national economy as a whole or through their relative and direct effects on the particular area being considered. To analyze the first type of impact, it is always necessary to perform a national simulation as part of carrying out a regional analysis. In the second case, the analysis can be conducted using a model with only regional variables and data.

An example of a nation policy change having significant, but diverse, impacts on local regions and governments would be the national health care proposals that were considered in the early years of the Clinton Administration. The principle health care proposals put forth involved massive regional spending shifts, changes in the composition of health care spending, and substantial increases in tax revenues coming from employees (in the form of an employee payroll tax) and businesses (in the form of a tax on their total payroll). Detailed analyses of the health care reform proposal were conducted at the state level. These studies indicated that in addition to national changes, there were substantial shifts in employment and income within industries and among states. Interindustry shifts occurred as labor-intensive industries became less competitive, and as many industries substituted capital for now more expensive labor. State impacts depended on their taxable income relative to their health care requirements, comparative industrial composition and labor intensity, the relative portion of the population previously uninsured, and comparative costs of delivering health care services.

ENERGY POLICY OR PRICES

To appreciate the significance of energy prices in the U.S. economy, one only has to recall that sharp rises in petroleum prices led directly to the two major recessions affecting this country since World War II. Energy costs affect the economies and governments of every region of the United States. Energy-producing regions may generally benefit from higher prices, which leads to higher production, higher employment, and higher wages. The governments in producer regions reap

increased revenues from production taxes as well as revenues from the higher level of activity in the region. Even energy-producing regions, however, face higher prices for this basic consumer item, which is also a major input into other industries.

Because energy use is ubiquitous, fuel costs significant, and fuel prices volatile, energy costs are an important aspect in all parts of the economy, even though direct fuel costs represent only a small portion of total production costs for most industries. An additional consideration in addressing energy issues is that fuel price changes often result from changes in government policies (national, international, or regional) as well as market forces. An economic model can be used to aid in viewing the effect of energy price changes as they relate to electric rates, natural gas rates, or transportation costs, and the resulting implications for the local economy. For example, a new state severance tax on natural gas increases consumer costs and business costs in the affected region. This leaves energy consumers with less to spend on other goods and makes the business in the region less competitive. The higher price for natural gas leads to a shift toward other energy sources, which may be imported from outside the region. If a substantial portion of the natural gas production is shipped outside the region, part of the tax burden can also be exported. The extent of the tax exporting will depend largely on the price elasticity of sales to the export markets.

A fuel price increase simulation is accomplished by increasing the appropriate fuel price variable in the model and by decreasing consumer purchasing power to reflect the extra amount that consumers will have to pay for energy. To complete any simulation, the effects on the production side must also be considered. Because fuels are often imported, the effect of changing energy strategies may be to substitute local production for imports or to replace local production with an external energy supply. Thus, even when the direct regional effects of fuel price changes are in one direction, the choice of energy source may have direct effects that will change the sign of the original effects. For example, higher petroleum prices lead to lower petroleum use and lower direct petroleum-related employment. They may also lead, however, to substitution to locally produced natural gas, which might have greater direct employment effects.

SOME SUGGESTIONS FOR USERS OF ECONOMIC POLICY MODELS

There are certain “tricks of the trade” in using economic models. Practicing these techniques should

allow the user to improve their analysis and to avoid time-consuming difficulties:

1. Check to see if the results make intuitive sense. Look carefully at the “big numbers,” such as total personal income, total employment to develop a perspective of the analysis. It is often easier to spot changes that seem disproportionate or counter to experienced expectations when looking at the big numbers rather than the more specific details.
2. When simulating a change that requires using several variables, run each variable as a separate scenario, and check the results carefully to develop an understanding of the specific effects of each. The results of using each variable should make sense on its own. Remember, however, that when using two or more variables (in a model with built-in feedback features), the results from using the variables together may, in fact, be different than the sum of the variables used separately.
3. When comparing two or more scenarios, make certain that the same methodology was used in developing each. Different methodologies can produce outcome differences that are purely a function of the approach, not the policy. This can be particularly significant when considering multiperiod simulations, where methodological differences are compounded with each period.
4. Graphing the results often reveals patterns that may not be otherwise apparent. Graphs are also often easier for audiences to quickly comprehend.
5. Economic models cannot read legislation. It is the model users responsibility to insure that the analysis is conducted accurately and reflects the actual policy proposal. Subtle nuances in statutory language can produce substantial differences in economic outcomes.

APPENDIX

There are numerous sources for regional economic policy models. Regional Economic Models, Inc., of Amherst, Massachusetts (www.remi.com), and the Minnesota IMPLAN Group of Stillwater, Minnesota (www.implan.com), are among the leading commercial sources of vendor-supplied models, while the Bureau of Economic Analysis will provide tables of regional

multipliers that can be used to develop independent models. In addition, many universities and research institutions offer various forms of regional policy models, some of which may be highly specialized (focusing on an industry such as agriculture, tourism, or the utility sector, for example), relatively simplistic (and relatively inexpensive), or are primarily forecast (as opposed to policy analysis) oriented.

Validation

Teva J. Scheer

University of Colorado at Denver, Highlands Ranch, Colorado, U.S.A.

INTRODUCTION

Validity refers to the degree to which a test or other selection devices measure a candidate's possession of specified characteristics. The Uniform Guidelines on Employee Selection Procedures, which provide companies and government agencies guidance on ensuring that their selection processes meet acceptable standards in discrimination cases, specify three types of validation strategies that employers may use for their selection devices. This study explains these methods and provides general guidance on when each is appropriate.

WHAT IS VALIDITY?

Besides the definition provided for validity earlier, one eminent statistician describes *validation* as “the process by which a test developer . . . collects evidence to support the types of inferences that are to be drawn from test scores.”^[1] Selection devices include written tests, qualification standards, assessment centers, performance tests, and employment interviews. Examples of characteristics that a selection device might measure range from innate ability (such as IQ), to interpersonal characteristics (like dependability), to job qualifications (knowledge of accounting principles being an example). The three strategies specified in the Uniform Guidelines are criterion-related, content, and construct.

CRITERION-RELATED VALIDATION

Criterion-related validation is a statistical method in which the results of a selection device (e.g., test scores) are compared to a measure of on-the-job performance criteria (e.g., performance appraisal scores, quality rates, or productivity statistics). The relationship between the scores and the performance measures is then computed using a validity coefficient. The higher the validity coefficient, the greater the validity of the selection device.

Some of the issues associated with criterion-related validation studies are: (a) selection of meaningful and measurable performance criteria; (b) insufficient

sample size to meet statistical standards; (c) in-house possession of the necessary statistical expertise to perform a criterion-related study or the funds to contract outside expertise; and (d) restriction of score range. The last of these relates to the need to ensure that the sample reflects the entire range of test scores, from high to failure. This is a particular problem for most government agencies that are restricted to selecting from among the highest-scoring candidates.

CONTENT VALIDATION

Content validation studies typically rely on subject matter experts or SMEs, i.e., supervisors and workers who are experienced and knowledgeable about the occupation, and who work under the guidance of a human resources specialist trained in job analysis techniques in developing the selection instrument. In a content validation study, the SMEs complete a structured job analysis to identify and organize the content elements (e.g., tasks or major job duties) of the job to be filled. The SMEs then identify examples of experience or education that would be acceptable evidence of the content elements. These are bundled into a scorable rating guide. For example, if SMEs in a customer call center determine that problem resolution is a major job duty for their customer service representatives, they would need to identify job experiences, duties, or training classes that are evidence a candidate can perform this important task. Each candidate is then scored, based on the relevance of his or her experience and education to the evidences provided by the SMEs.

Content validation relies on logic rather than statistics.^[2] It is an appropriate method where the limited number of selections and/or applicants precludes the use of a statistical method—for example, when a local government agency needs to advertise for and select a Budget Analyst. While a rigorous job analysis is required for each type of validation, it is particularly critical for logical methods of validation. The written documentation of the job analysis establishes the link between the job content and the evidences that were identified by the SMEs and formed the basis for ranking the candidates. Content validation relies on the following syllogism: If $A = B$ and $B = C$, then

$A = C$. For example, if the [SMEs' rating guide] measures [skill in writing technical reports] ($A = B$) and [skill in writing technical reports] is critical for [success on the job] ($B = C$), then a [high rating guide score] will result in [success on the job] ($A = C$).

CONSTRUCT VALIDATION

Construct validation relies on the same logical syllogism as content validation. However, construct validity job analyses focus on identification of psychological constructs rather than job content elements. Constructs, unlike content elements, are not directly observable. In a construct validation study, a psychologist analyzes the constructs necessary for success on the job and then identifies tests that measure these constructs. For example, if an identified construct is high intelligence, then the Wechsler tests could be used to assess candidates' IQs. If an identified construct is high extroversion, then the Myers Briggs Type Indicator could be utilized to assess candidates on the extroversion–introversion scale.^[1]

SELECTING THE APPROPRIATE TYPE OF VALIDATION STRATEGY

In 1979, the Equal Employment Opportunity Commission (EEOC) issued the first set of questions and answers designed to clarify the Uniform Guidelines' requirements for employers. In response to a question about how to determine when each of the validation strategies is appropriate, the EEOC stated:

“A user should select a validation strategy or strategies which are: (1) appropriate for the type of selection procedure, the job, and the employment situation and (2) technically and administratively feasible. Whatever method of validation is used, the basic logic is one of prediction; that is, the presumption that level of performance on the selection procedure will, on the average, be indicative of level of performance on the job after selection. Thus, a criterion-related study, particularly a predictive one, is often regarded as the closest to such an ideal.... Key conditions for a criterion-related study are a substantial number of individuals for inclusion in the study, and a considerable range of performance on the selection and criterion measures. In addition, reliable and valid measures of job performance should be available, or capable of being developed.... Where such circumstances exist, a user should consider use of the criterion-related strategy.

“Content validity is appropriate where it is technically and administratively feasible to develop work samples or measures of operationally defined skills,

knowledges, or abilities, which are a necessary prerequisite to observable work behaviors. Content validity is not appropriate for demonstrating the validity of tests of mental processes or aptitudes or characteristics; and is not appropriate for knowledges, skills or abilities which an employee will be expected to learn on the job....

“The application of a construct validity strategy to support employee selection procedures is newer and less developed than criterion-related or content validity strategies. Continuing research may result in construct validity becoming more widely used. Because construct validity represents a generalization of findings, one situation in which construct validity might hold particular promise is that where it is desirable to use the same selection procedures for a variety of jobs. An overriding consideration in whether or not to consider construct validation is the availability of an individual with a high level of expertise in this field.”^[3]

Values and Policy Analysis

Steven A. Peterson

*School of Public Affairs, Pennsylvania State University at Harrisburg,
Middletown, Pennsylvania, U.S.A.*

INTRODUCTION

Policy analysts cannot avoid the importance of values in their work. Policy analysis is grounded in values. This article focuses on a number of issues: the role of values held by the policy analyst, by policy-makers, and by the larger society. Values at each of these levels affect the nature of policy analysis and the conclusions that emerge from such analysis. Value conflicts can arise from this situation, and the variety of responses available to policy analysts when conflicts occur are described. In a very real sense, there can be no “value free” policy analysis.

INTRODUCTORY COMMENTS

Values are an integral part of the process of policy analysis—from selecting questions to be asked or problems to be addressed, to selecting items for the policy agenda, to determining which policy option appears most likely to meet problems identified as worthy of government action.

Indeed, in one of the seminal essays regarding policy analysis, Harold Lasswell was quite explicit regarding the role of values. For instance, he notes that “The policy-science approach not only puts the emphasis upon basic problems and complex models, but also calls forth a very considerable clarification of the value goals involved in the policy.”^[1] In a larger sense, the value of democracy is central for Lasswell’s policy orientation. As he says, “It is probable that the policy-science orientation in the United States will be directed toward providing the knowledge needed to improve the practice of democracy. In a word, the special emphasis is upon the policy sciences of democracy, in which the ultimate goal is the realization of human dignity in theory and fact.”^[1]

INDIVIDUAL VALUES AND THE POLICY ANALYST

Paris and Reynolds observe that each person has values that are central to himself or herself. They refer to these as “Individual Overriding Values” (or

IORVs). These tend to be stable and they rank very highly in a person’s hierarchy of values. Paris and Reynolds further note that “They are called overriding because owing to their features, they can be used to override other lesser values and to resolve conflicts between other values when these occur.”^[2] When we examine the world of the policy analyst, IORVs become valuable to understand, as there may be times when the analyst’s fundamental values come into conflict with those of policy-makers. At such times, value conflict can prove to be a challenge for the analyst.

What is apt to be the outcome of such conflicts? Weimer and Vining^[3] use the work of the economist A.O. Hirschman^[4] to outline the options available under such conditions. They assert that the analyst has three choices—exit, voice, and disloyalty. For example, if key political figures demand “cooked results” (i.e., that the analyst skew results to fit the politicians’ desires) or if political figures misrepresent results of policy analysis in public statements, what is to be done?

Exit would be the situation where the analyst feels that he or she has been so compromised that it is necessary to leave the organization. Voice would represent those circumstances where the analyst would make the effort of working from within an organization to change its way of doing business. Finally, and perhaps most dramatically, disloyalty. For instance, if the agency were trying to suppress a policy analysis that questioned the choice actually made by the organizational leaders, then the individual might leak the original results to the media. Thus if an individual’s values were violated by the organization’s behavior, he or she could exercise exit, voice, or disloyalty.^[3]

VALUES OF POLICY-MAKERS AND POLICIES

Traditionally, a small array of values has been described as most salient for policy-makers’ selection of policy choices. Among the most important: equity, efficiency, and effectiveness. Equity is normally defined rather straightforwardly as “treating likes alike.”^[5] Another view is that equity is to be defined in terms of “fairness.”^[3] Or, as Peters puts it, “. . . it is argued that government has the legal and economic capacity

to redress inequities in the distribution of goods and services that result from the operation of the marketplace.”^[6] Unfortunately, once one gets past these generic definitions, the actual means by which one applies equity to policy choices is not always clear. Stone has used the example of dividing up a piece of pie “fairly” in her college class. Should everyone get the same sized piece? What about those who do not attend class regularly? If those people get the same sized piece of pie, is that fair to the regular attendees? What if a student is allergic to chocolate? That person is being deprived of a good that others are receiving. Should some compensatory treat be provided to that person?^[5]

Efficiency refers to producing the most units of service for the best price, or, as Stone puts it, “getting the most output for a given input.”^[5] Market-oriented policy choices are often advanced as solutions because they may be more efficient. However, efficiency may not always translate into fairness or effectiveness (i.e., policies that have a desired effect on the original problem). Thus the concept of tradeoff is introduced. Emphasizing one value may lead to a diminution of other values. We may have to trade off some effectiveness or equity in return for enhancing efficiency.

Effectiveness would be defined as the extent to which policy choices meet goals and address problems. Effective programs are those that solve problems. However, as noted before, this may produce tradeoffs. We might be able to assure decent housing for all, by giving everyone who has inadequate housing a voucher for, let us say, \$50,000 to purchase adequate housing. This would create a market for housing and, theoretically, address the problem. However, this might be considered to raise issues of equity (What about those who are not so well off who have been able to purchase decent housing while making other sacrifices?) or of efficiency (Is this a cost-effective approach to housing?).

SOCIETAL VALUES

Paris and Reynolds refer to the salience of Societal Overriding Values (SORVs, to use their acronym). These are values held by a large majority of citizens and represent basic societal orientations. As the authors suggest, “For a value to count as an SORV there must be a consensus, or something close to it, on just exactly what counts as satisfying the value.”^[2]

In political scientist E.E. Schattschneider’s view, biases are built into the political system. He has pointed out that “All forms of political organization

have a bias in favor of some kinds of conflict and the suppression of others because organization is the mobilization of bias. Some issues are organized into politics, while others are organized out.”^[7] In a sense, these biases are SORVs, in that they are broadly diffused throughout society and structure discourse (i.e., people use the biases to make decisions without realizing that, in fact, these biases are arbitrary and a construction of the particular society—not based on a priori universal truth).

Any political unit’s SORVs will narrow the range of issues considered appropriate for agenda placement. For instance, in the states of the Deep South before the 1960s, white supremacy values would make it literally impossible for the governor of one of those states to suggest placing on the agenda the issue of integration of racially segregated schools. This issue would be “mobilized out” of consideration for agenda placement, as it went against basic values accepted by whites and their elected representatives. Biases, then, can reduce the scope of debate in the political process radically and prevent certain policy alternatives from ever being examined, no matter their objective merits.

CONCLUSION

Thus values have a role to play in the process of policy analysis. Indeed, it would be amazing if this were not so. The world of the policy analyst is one in which values structure the process and shape outcomes.^[8]

Virtue Ethics

James S. Bowman

Askew School of Public Administration, Florida State University, Tallahassee, Florida, U.S.A.

INTRODUCTION

Virtue ethics, the dominant outlook in classical Greek philosophy, holds that excellences of character are of central importance in moral life. The analysis of subjective personal traits is ill-suited, however, to subsequent Enlightenment theories that grounded ethics not in individual character but in moral actions subject to universal, rational rules. These approaches concentrate on morally right action as determined by its consequences (in utilitarian, teleological ethics, actions should produce the greatest good for the greatest number) or absolute moral duty (in Kantian, deontological ethics, it is imperative that actions categorically follow principles irrespective of results). Contemporary dissatisfaction with these schools of thought has led to a revival of virtue ethics—those traits that characterize a morally good person. That is, one needs to look for moral norms, not in consequences or duties, but in personal virtues that permit human beings to flourish.

Virtue ethicists claim that consequential and duty ethics are incomplete, because they are derived from something more fundamental: right actions are defined by those done by moral people.^[1] The actual substance of morality cannot be understood by predicting outcomes or adhering to duties. Goodness is the result of internal imperatives to do right, not sanctions from moral rules or rewards from expected consequences. Formulation of a problem can never be a purely technical procedure. People do good not because of reasoning about moral dilemmas, typical of the other perspectives. Instead, they do good as a result of personal conviction, incremental development, behavior patterns, and the everyday choices stemming from them. Sound judgement is based on good character; beliefs, sensitivity, and experience are key in ethical life and should not to be taken for granted, as alternative schools of thought tend to do.

Reason may be essential in carrying out decisions, but behind every action is an individual; before we can do, we must be. The primary faculty is moral sense and intuition, not intellect; reason is easily led into error, and many do not have the capacity or training for analytical logic. Virtue ethicists contend that answers to the question of “What to do?” have little to do with depersonalized calculation of consequences or resolving conflicting duties, and everything to do

with what kind of person one is. It is more important to “know thyself” than to know anticipated results or inflexible rules. Thus, the philosophy is rooted in the reality of living and how decisions are made; indeed, our everyday moral judgements often are judgements about someone’s virtues and vices.

If a professional is defined as having technical competencies (what to do) and moral competencies (whom to be), then consequential and duty theories build on the former, and virtue ethics the latter.^[2] Virtue requires an individual not simply to know how to predict results or apply duties, but also why to do so; ethical questions are more than simply decision puzzles. This is because to be a human being is to possess the potential to be excellent, excellence that it is one’s responsibility to develop. Indeed, professionals may be required to perform supererogatory acts, or do more than is normally required, demanded, or expected (e.g., a mental health worker has a stronger duty to provide help to someone at risk than a member of the public). It is evident, then, that ethics is not an imposition or constraint in professional life, but the foundation of everything a professional is and does. As such, virtue theory may even help resolve the “dirty hands” dilemma^[3] encountered by public officials who may be conflicted between utilitarian concerns for the public interest and the duty to adhere to laws.

TERMINOLOGY

Critical concepts—character, virtue, integrity, practical wisdom—need examination to comprehend the range of virtue ethics. Character is a person’s pattern of behavior related to the moral qualities of individual self-discipline and collective social responsibility; one cannot be understood apart from the larger community in which one participates. Good character is not an accident; it is a lifelong process of self-discovery requiring commitment to ethical values. Character is one’s moral center or “naked soul.” One test of character is what one would do if one were invisible. Does the person, in modern vernacular, have the “right stuff” to do the right thing? Good people make moral choices. The reply to “What is a good life for a human being?” is to create a moral character, to achieve excellence in all aspects of life, to live virtuously with others,

in brief, to become a “virtuoso.” In reciprocal fashion, virtuous citizens build moral communities that, in turn, encourage further character formation.

Virtue is a trait or excellence of individual and societal character. Virtues are principles of goodness and rightness in character and conduct (e.g., justice, courage, temperance) that lead toward moral nobility and away from depravity. Woven into character, they are ingrained dispositions to act rightly, developed by practice, just as vices are tendencies to act wrongly. Not easily honed, virtues make people sensitive to ethical issues and shape how they think and act. One becomes courageous, for example, by repeatedly behaving in a courageous manner. Virtue is found between the vicious extremes of excess and deficiency—Aristotle’s “golden mean.” In every situation, a person of character will select actions based on reason and experience that are appropriate—neither excessive nor defective—for that circumstance. The virtue of mildness, for instance, rules that one may get angry, but only in certain proportions warranted by occasion. What is prudent in one situation may not be in another. Such individuals are guided by their principles, not popularity or expedience. Virtues are more than habitual skills enabling right action; they promote the attainment of what it means to be human, to function well, to be moral.

Integrity, a product or synthesis of virtues, is a predisposition to maintain one’s virtues and act in character. In today’s parlance, this is consistency between belief and action, to “walk the talk,” to “have it all together.” It is the aptitude to contemplate one’s roles and obligations and nurture a moral soundness as a person as well as a member of the community. It grows from internal values, experiences, and the ability to act thoughtfully; it is one’s “moral identity.”

To act thoughtfully requires practical wisdom (judgment, prudence), the capacity to distinguish right from wrong and take sensible action. The reflective person recognizes the distinction between knowing and doing. Moral virtue directs one to the right end; practical wisdom directs one to the right means. Practical wisdom enables one to discern the golden mean in particular situations, a process requiring experience that cannot be reduced to rules.

Essential for an ethical life, practical wisdom engages and unifies the intellectual and the moral: right action requires intellectual judgment, which requires moral virtue. It has no standard external to itself; to act rightly is to do what a good person would do in a particular circumstance. One deliberates as long as necessary and then acts decisively with compassion, precision, and speed. One must see a duty and do it; in fact virtuous action, founded upon arduous practice, may be nearly spontaneous. To summarize briefly, character (personal behavior patterns) is enriched by

virtues (disposition to act); a synthesis of them constitutes integrity, something that can be achieved through the exercise of practical wisdom, which is known as the preeminent virtue.

VIRTUE THEORY PRINCIPLES

Over thousands of years, diverse cultures have constructed various accounts of life to serve as moral guidelines (often included are hope, love, honesty, prudence, temperance, justice, courage, faithfulness, loyalty, wisdom). Compiling such lists misses an important point made by virtue ethicists: to avoid a formulaic approach to ethics by emphasizing its context and personal nature. This means that the content of a norm cannot be defined in general principles but by mediating upon the lives of admirable people.

Virtue ethics, then, is a way of life more than a method of analysis. That is, the mere possession of virtues is not enough, because character is more than the result of individual traits added together; instead, character is transformative, as one must also have practical wisdom to know how and when to exhibit individual virtues.^a Thus, Aristotle,^[5] who believed that virtues are learned concurrently, did not produce a definitive list but identified assorted virtues on the grounds that they were the mean between extremes; the essence of virtue is between the vices of excess and deficiency (e.g., honesty is between bluntness and deceit). Such counsel encourages decision makers from veering too sharply in one direction or another, thereby violating fundamental values; balance is a moral ideal when important values are pitted against each other.

For students of administration and policy, some standards have appeared in the professional literature.^[6] Bailey’s^[7] mental attitudes (recognition of moral ambiguity, contextual forces, and paradox of procedures) and moral qualities (optimism, courage, fairness) are useful to officials as ethical custodians of public organizations and democracy (Table 1, top panel). Denhardt^[8] recommended honor, benevolence, and justice (Table 1, bottom panel). Hart^[9] saw public administration as a moral endeavor demanding “superior prudence” (the power to transcend self-interest and seek the public good), which includes moral heroism, care for humankind, trust in the citizenry, and continuous improvement of honorable character.

Whether long or short, a list will have coherence when the habits and dispositions to achieve the good life are mastered. Virtue theory contends that the whole of

^aBen Franklin describes in his autobiography how he nurtured some dozen virtues he thought important to a meaningful life. A modern-day approach to such habituation is found in Ref. ^[4].

Table 1 Selected administrative virtues*Bailey*

Mental attitudes—recognition of:

- Moral ambiguity of people and policy (dirty hands).
- Contextual forces that condition priorities in public service (lie to a terrorist).
- Paradoxes of procedures (friend of deliberation, fair, law but may be enemy of progress and speech).

Moral qualities:

- Optimism (incentive to improve quality of life).
- Courage (needed to face ambiguities, duty to act).
- Fairness tempered with charity (compensates for inadequate information).

Denhardt

Honor: magnanimity (great mindedness), honesty, acting honorably (high standards).

Benevolence (promote welfare of others): sympathy, enthusiasm, commitment to serve.

Justice (respect for and commitment to the dignity and individual worth of each person): includes promoting informed participation.

Source: From Refs.^[7,8]

character is greater than the sum of its parts; a compilation of virtues is not as important as blending a set of desirable qualities to form an ethical character. No easy task, it is hardly surprising that some prominent leaders demonstrate not only moral strengths but also weaknesses. The leadership challenge is to deal thoughtfully with clashes between virtues; such conflicts will then yield integrity and personal growth. As a result, ethical managers are likely to be prepared to deal with unexpected problems, recognize dilemmas when they arise, and justify decisions on proper grounds.

ADVANTAGES AND DISADVANTAGES

For virtue ethicists, other approaches do not provide an adequate account of moral existence, because they focus on intellectualistic efforts to resolve ethical problems after individual characters are presumably set. While these theories maintain that they incorporate aspects of virtue ethics, virtue ethics presents a different conception of morality as well as what is important in moral evaluation by emphasizing personal development and reflective judgment. This philosophy contains advantages and drawbacks.

The chief advantage is its claimed realism by attending to the actual dynamics of life in several respects. First, by valuing being rather than doing, it emphasizes everyday experiences, not dramatic cases. People do not decide what to do by simply relying on abstract rules or estimating consequences. Instead, they learn

ethics and sound judgment by living ethically, more than they do by coping with extraordinary incidents. The sensitivity of a virtuous person is central. Knowing the distinction between right and wrong is necessary, but not sufficient; caring about the difference is also required.

Consequential and duty ethics, in contrast, are cold, calculating, and callous, because they leave out an essential part of reality: human feelings. A theory of ethics must deal with the whole person. Virtual ethics centers on the question, “What is a moral life?,” whereas other approaches ask, “What is the right thing to do in a situation?” In so doing, the latter represents a minimalist approach, because the instrumental focus makes minimal demands on people (“ethics without virtue”); the former is a maximal approach, because it demands deep reflection and high ideals.^[10]

Second, virtue ethics maintains that people become moral from what they demand of themselves in their characters (e.g., the reason to be considerate of others is not the impact on them but the effect on one’s self). Indeed, cultivating virtue helps them from being entrapped by moral dilemmas in the first place. The disposition to do the right thing is a prerequisite to, and more vital than, merely knowing what is right.^b Proper action results from thoughtful judgment informed by virtuous concern. Virtues are a kind of second nature that lead one to do the correct thing and provide pleasure in so doing. To consider character as static and unimportant, as the other schools tend to do, misses the essence of ethics.

Weaknesses in virtue ethics include a key limitation of, and several flaws in, the theory. The limitation is that it, by definition, lacks a theory of action; right conduct is not codified into general guidelines. While alternative theories compel decisions (although they may not provide clear guidance in specific cases), virtue philosophy says little about what should be done. Virtues may generate instructions for action (e.g., justice provides motivation to act justly), but what, exactly, does a just person do in problematic circumstances? Many situations cannot be reduced to character

^bThis distinction between knowing and doing can be illustrated by former Texas Governor Ann Richards, past Senator George Mitchell, and one-time Reagan White House Chief of Staff former Senator Howard Baker. In 1997, the tobacco industry hired them to lobby Congress. Each widely-known for integrity, Richards (a recovering alcoholic, knew well the problem of addiction), Mitchell (a peace negotiator, could work for life in Ireland and death in America), and Baker (whose wife died of lung cancer) earned huge sums of money for their efforts. In comparison, Reagan’s Surgeon General, C. Everett Koop, upon leaving office in 1989 refused to endorse breakfast cereals and condoms—actions that were at least consistent with good health. Not wanting to cheapen his office by selling his name, he turned down millions of dollars.

As one moves out from the triangle, the ethical basis for action is weakened and unethical actions may seem justifiable. In addition, reinforcement from other bases is decreased. As one moves in toward the triangle, the reinforcement among bases is increased.

Fig. 1 Ethical triangle. From Ref.^[13].

virtues, traits which, paradoxically, are often defined as how a good person would act. A further complication is when someone “acts out of character” in a particular circumstance.

Relatedly, the initial theoretical flaw, ironically, is that virtue ethics lacks integrity—one may be good but may not know how to do good. Confusing being with doing can lead to self-righteousness; if one thinks he is good, then it is not hard to believe that what one does is good.^c Too, when confronted with conflicts among virtues, the only way to resolve them may be through the use of other moral philosophies.

Another flaw is that virtue ethics lacks context, as it is only in the *polis* that virtues can be exercised and the good life achieved. “To lead a good life and to be a good person,” according to the Greek saying, “one must live in a great city.” But without appropriate opportunities in the community, humans may be incapable of virtue. Thus, the infamous Milgram^[11] electric shock experiments demonstrated that significant numbers of people are unable to act morally in situations calling for obedience to authority [also see the notorious 1971 Zimbardo “Stanford prison experiments” (<http://www.prisonexp.org>)].

^cDuring the US Department of Housing and Urban Development (HUD) scandals in the 1980s, for example, agency official Marilyn Harrell received notoriety as “Robin HUD.” She testified in 1989 that she diverted public funds to the poor—and to herself.

Finally, the approach lacks universality, as there is no general theory of human virtue. Virtue seems to vary from time to time and place to place, and the same virtues may not apply to all people (e.g., men versus women, young versus old). Personal characteristics seem to invite an arbitrariness into moral considerations that the dominant moral philosophies of the last 200 years have attempted to avoid. If feelings are central, then ethical life is built on little more than the subjectivity, human emotions, and inconsistencies of daily living.

REINTEGRATION OF CHARACTER AND ACTION

Modern ethical systems distinguish between an individual’s character and an individual’s action, with action being more morally salient, because it affects others. By reviving the classical view that a person’s life—to be of general moral significance—must be one based on character, virtue ethicists have stimulated a reexamination of morality, the nature of ethical problems, and the extent to which they admit to solution. Accordingly, they argue for the reintegration of character and action, because personal virtue can be an important determinant of action.^[12]

Because ethical practices must deal with the entire person, management professionals are obligated to develop virtues, predict consequences, and adhere to rules—to be conversant with virtue, consequential, and duty ethics. The complementarity and interdependence

of these three theoretical perspectives is illustrated by Svvara's^[13] "ethical triangle" (Fig. 1). Each school, represented in the triangle, provides a way to reframe or clarify what is at stake in a problem. As one moves out from each point, the justification for action—and reinforcement from the other angles—weakens. Conversely, operating within the triangle mitigates against the key shortcoming of virtue (self-justification), consequential (expediency), and duty (rigid application) ethics.

The three angles often inform and supplement one another in a synergistic manner. When they do not, at least all perspectives will have been considered, and a reasoned choice—based on benevolence, the public interest, and moral imagination—can be forged and defended. As such, this integrative, robust geometric tool promotes an ethic of compromise and social integration, a key tenet of democracy. It is a parsimonious analytic device that helps professionals from straying too far from virtues, outcomes, and duty. The revival of virtue ethics, accordingly, has encouraged a scrutiny of moral theory and what it might reasonably accomplish, and has painted a more complete portrait of morality in public affairs.

Watergate

Carol W. Lewis

Department of Political Science, University of Connecticut, Storrs, Connecticut, U.S.A.

INTRODUCTION

On June 17, 1972, a security guard at Watergate, a Washington hotel and apartment complex along the banks of the Potomac River, notified police when he saw that a stairwell door had been taped open. At 2:30 a.m. in the Democratic National Committee's headquarters, the three responding officers arrested five intruders, who were there to adjust bugging equipment installed in May and to photograph documents. This incident, which the president's press secretary (Ron Ziegler) labeled a "third-rate burglary,"^[1] was the public beginning of a series of events collectively termed *Watergate*. Its full story unfolded slowly,^[2] in bits and pieces, and ultimately developed into protracted political discord that "captured headlines... permeated the national consciousness and evolved into an ethical and constitutional landmark."^[3]

Within a few days, a relationship was established between the burglars and a former White House aide (E. Howard Hunt) and the general counsel for the president's re-election committee (G. Gordon Liddy). Seven indictments came down from a federal grand jury within several months, while the president repeated his denial of knowledge about and involvement in the incident.^a

BACKGROUND

In 1968, after serving as vice president under President Dwight D. Eisenhower and losing the presidency to John Fitzgerald Kennedy in 1960, Richard Milhous Nixon defeated Hubert Humphrey in one of the closest elections in U.S. history. When sworn in as the 37th president on January 20, 1969, he took the oath stipulated in the eighth clause of Article II, Section 1 of the U.S. Constitution. "I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States." The fact that Nixon was re-elected

on November 2, 1972, less than five months after the Watergate break-in, in a landslide victory, adds a poignant and perplexing note to the affair that ultimately led to the first resignation of a president in U.S. history. (Nixon won re-election by more than 60% of the vote, carried 49 of the 50 states, and defeated the Democratic candidate, Senator George McGovern of South Dakota.)

An explanation (but by no means an excuse) for the wrongdoing by the president and advocates of his re-election, followed by deceit, denials, and illegalities, lays at least in part in the context surrounding this White House. Operating in a political world broader than electoral calculations, this was an administration besieged by the myths and realities of deep discord associated with the war in Vietnam, the Civil Rights Movement, political assassinations of the 1960s, and the decline in confidence and trust in government already evident in national surveys.^b Indeed, this was an era of domestic turmoil and social change.^c Also, and especially important in this context, a Republican president saw himself and his policies repeatedly thwarted by a Democratic majority in Congress and an unresponsive bureaucracy. Moreover, Nixon is said to have been "a man obsessed" by his 1960 defeat and by President Kennedy and his legacy.^[8]

The links between these factors and Watergate—and the mentality prevailing in the White House—are evident in the events surrounding the Pentagon Papers. In June, 1971, a year before Watergate, first *The New York Times* and later *The Washington Post* begin publishing the Pentagon Papers, the Defense Department's secret history of the Vietnam War leaked by Daniel Ellsberg, a former defense analyst. The White House plumbers, a staff group so named for their job to plug leaks in the administration, burglarized a psychiatrist's office to find materials on Ellsberg.

Another factor came into play as Watergate unfolded and would serve to further undermine the administration's credibility. Vice President Spiro T. Agnew took office in 1969 but resigned late in 1973,

after pleading no contest for evading income taxes on kickbacks he received when governor of Maryland.^[9] Under the authority of the 25th Amendment to the U.S. Constitution, President Nixon appointed U.S. Representative Gerald Rudolph Ford. Elected by voters in a single congressional district in Michigan, albeit 12 times, Ford would become the 38th president upon Nixon's resignation nine months after he was sworn in on December 6, 1973.^d

COVER-UP AND DISCLOSURE

The links to the Oval Office got stronger and stronger as information trickled out or was ferreted out. Initially at least, the protagonists were not talking, and links with the White House and the president's campaign were denied repeatedly. The cover-up could be dated as early as two days after the break-in because, on June 19, 1972, former Attorney General John Mitchell, the head of Nixon's re-election campaign, denied any association with the affair.

Watchdog Press

The cover-up was undone by a free media and by hearings held by a Congress dominated by Democrats.^e The press undeniably fulfilled its promise in a democratic polity, despite threats and intense pressure.^[1] The *Washington Post* and its two investigative reporters, Carl Bernstein and Bob Woodward, played a major role in following the trails of abuses and disclosing the cover-up. CBS News and the *Los Angeles Times* also chased the story (and the *New York Times* first published the Pentagon Papers). Woodward and Bernstein's work would win the *Washington Post* a Pulitzer Prize for public service and result in the book and film, *All the President's Men*.^[11]

The first paragraph of the first big story by Woodward and Bernstein was published on August 1, 1972. It declared, "A \$25,000 cashier's check, apparently earmarked for President Nixon's re-election campaign, was deposited in April in a bank account of one of the five men arrested in the break-in at Democratic National Headquarters here June 17."^[12] The burglars were connected to the president's re-election committee. Their article, published under the headline "FBI Finds Nixon Aides Sabotaged

Democrats" on October 10, began, "FBI agents have established that the Watergate bugging incident stemmed from a massive campaign of political spying and sabotage conducted on behalf of President Nixon's re-election and directed by officials of the White House and the Committee for the Re-election of the President."^[13] These and other stories about the break-in apparently had little or no effect on the election, and Nixon won his landslide victory.

Whitewash at the White House

Approximately five months later, President Nixon offered the strongest case he would make in his own defense. On April 30, 1973, he reaffirmed his innocence in a nationally televised speech. In what would prove to be a useless attempt to offer up scapegoats and deflect attention from his own role, he announced the resignation of his two senior White House aides (H. R. Haldeman and John Ehrlichman). He described these sacrificial lambs as "two of the finest public servants it has been my privilege to know." The resignation of the attorney general (Richard Kleindienst) was announced, along with the dismissal of the president's special counsel (John W. Dean III), whose revelations subsequently implicated the president in the cover-up.

The president characterized his newly appointed Attorney General, Elliot Richardson, as "a man of unimpeachable integrity" and gave him "absolute authority to make all decisions bearing upon the prosecution of the Watergate case and related matters" and to name a special prosecutor. Of Richardson, Nixon remarked, "I am confident that with him in charge, justice will be done." (His words would be remembered and fuel the fires ignited by the so-called Saturday Night Massacre, discussed below.)

In his speech, President Nixon also affirmed that "in matters as sensitive as guarding the integrity of our democratic process, it is essential not only that rigorous legal and ethical standards be observed but also that the public, you, have total confidence that they are both being observed and enforced by those in authority and particularly by the president of the United States."

In this speech, the president "made promises that would prove to be both important and empty."^[3]

Whatever may appear to have been the case before, whatever improper activities may yet be discovered in connection this whole affair, I want the American people, I want you to know beyond the shadow of a doubt that during my term as president, justice will be pursued fairly, fully, and impartially, no matter who is involved. This office is a sacred trust and I am determined to be worthy of that trust . . . We must

^d"Gerald Ford served in the House of Representatives from January 3, 1949 to December 6, 1973, being reelected twelve times, each time with more than 60% of the vote." Gerald R. Ford Biography at <http://www.ford.utexas.edu>, accessed September 2001.

^eA detailed chronology is available at <http://www.washingtonpost.com/wp-srv/national/longterm/watergate/front.htm> and, for a point-by-point rendition, see Ref. ^[10].

maintain the integrity of the White House, and that integrity must be real, not transparent. There can be no whitewash at the White House.

Over time, it would become clear that this speech was an instance of outright deceit. It is to this deceit that Theodore H. White, a best-selling chronicler of presidential politics, attributed Nixon's downfall. In his book entitled *Breach of Faith*, White wrote that a government official "must know when to choose trust and faith over political need. If exposure of his acts threatens to contradict his words, he must renounce his acts and keep his word, because the people must trust his words at whatever cost—or he cannot govern."^[7]

Saturday Night Massacre

The president's "assurances explain why the whirlwind touched down on October 20, 1973, the date of the [so-called] Saturday Night Massacre."^[7] The controversy over releasing taped presidential conversations—the authority of Congress to issue subpoenas versus claims of executive privilege—provoked President Nixon to order Attorney General Richardson to fire Archibald Cox, the special prosecutor Richardson had appointed subsequent to Nixon's speech the previous April. (Cox was a former solicitor general.) Rather than comply, Richardson and his deputy (William D. Ruckelshaus) resigned. Solicitor General Robert Bork became acting attorney general and fired Cox. "Seeing discharging the special prosecutor as a legal matter, not a moral one, Bork explained that he was trying to maintain the viability and integrity of the Department of Justice and, indeed, the executive branch of government."^[14] A Federal District Court ruled in 1973 that the firing was illegal. President Ronald Reagan nominated Bork, by that time a federal judge, to the Supreme Court, but Bork was not confirmed.

Political analyses often draw upon historical precedents, which are useful in understanding the role of the special prosecutor. President Ulysses S. Grant, whose administration was disreputable at best, was the first president to appoint and the first to fire a special prosecutor. President Harry Truman's attorney general did likewise in 1952. Nonetheless, the political controversy escalated in response to the Saturday Night Massacre, as did public pressures and congressional resolve to investigate. Assurance had degraded into deceit and, for some, a sense of having been betrayed.

Congressional Investigation and the Tapes

The Senate Select Committee began its Watergate hearings—televised nationally—in May, 1973, under

the chairmanship of Senator Sam Ervin (Democrat, North Carolina). In early June, the public learned that a former counsel to the president (John Dean) had informed Watergate investigators that he had discussed the cover-up with the president almost three dozen times. In his congressional testimony less than two months later, the president's former appointments secretary (Alexander Butterfield) disclosed the existence of the White House's tape-recording system. Quickly, attention shifted to the tapes. On July 23, 1973, the president refused to release tapes to the Senate committee or special prosecutor. A battle would rage over the tapes in the press and in court for another year. In December, 1973, the disclosure of a gap of 18 1/2 minutes in one of the subpoenaed tapes would further undermine White House credibility and cement suspicion in some quarters.

IMPEACHMENT

Impeachment proceedings were initiated in the House Judiciary Committee, chaired by New Jersey Democrat Peter Rodino (with a quarter-century of House experience). Article I, Section 2 of the U.S. Constitution gives the House of Representatives "sole power of impeachment" (which amounts to an indictment). According to House procedure, the Judiciary Committee takes up the matter first and then makes its recommendation to the House. Congress conducted investigations of presidents as early as President James Monroe in the early nineteenth century.^[14]

At the end of April, 1974, the White House released more than 1200 pages of transcripts to the Judiciary Committee. The committee objected to the edited transcripts and demanded the tapes. On July 24, 1974, the Supreme Court, presided over by Chief Justice Warren Burger, rejected the claim of executive privilege and unanimously ruled that the president must deliver recordings of 64 conversations. Among them was the so-called "smoking gun," direct evidence of a specific illegal act that meets the stipulation in the Constitution (Article II, Section 4) of "treason, bribery or other high crimes and misdemeanors" for impeachment and conviction. While a majority of the members of the Judiciary Committee were persuaded by a pattern of illegal and abusive behavior, others objected that there was no single piece of evidence linking the president directly to impeachable action; still others argued that the proceedings were partisan in motive and less than objective and fair.

The link was established and an instance of obstruction of justice made certain by the tape of a conversation on June 23, 1972, between the president and his advisor (Haldeman) about using the CIA to put a stop to the FBI's investigation of the break-in. This

tape (and others released in later years) confirmed that Nixon knew about the cover-up from the start. The question repeatedly posed by Senator Howard H. Baker, Jr. (Republican, Tennessee), vice chairman of the Senate investigating committee—"What did the president know and when did he know it?"—was answered.^f

On July 27, 1974, after seven months of inquiry, in a roll call taking 3 minutes, the House Judiciary Committee approved the first of three articles of impeachment. Rooted firmly in the president's constitutional oath, it read in part:

In his conduct of the office of President of the United States, Richard M. Nixon, in violation of his constitutional oath faithfully to execute the office of President of the United States and, to the best of his ability, preserve, protect, and defend the Constitution of the United States, and in violation of his constitutional duty to take care that the laws be faithfully executed, has prevented, obstructed, and impeded the administration of justice.

The first article, charging obstruction of justice, was passed 27 to 11; six Republicans joined 21 Democrats in this historic decision.^[15] Note, however, that the vote preceded disclosure of the critical tape, the smoking gun. Chairman Rodino had predicted, "This is a turning point, whatever we decide," and he was correct. Impeachment precedents number about 50, but only about a dozen reached trial and only a single case had involved a president.^g The committee subsequently passed another article alleging abuse of power and a third alleging contempt of Congress. This committee would report for impeachment to the House.

RESIGNATION AND PARDON

The president now came under intense pressure from many quarters, including longtime political associates, Republican congressional leaders, and close advisors, to spare the country the prolonged, preoccupying, and now apparently fruitless drama of impeachment in the House and then a trial in the Senate. On August 8, 1974, the 37th president announced his resignation. (See Fig. 1.) He was the first U.S. president to do so. The White House biography of Nixon explains, "Faced with what seemed almost certain impeachment,

Nixon announced on August 8, 1974, that he would resign the next day to begin 'that process of healing which is so desperately needed in America.'"^[16]

According to one description of the events surrounding the resignation:

The 16 minute speech was delivered with remarkable restraint, given the circumstances, and without a trace of demagoguery or self-pity. There were no attacks on his old enemies, no visible bitterness. There was also no concession of anything more serious than "mistakes" in his handling of Watergate, and no hint of remorse except one line regretting "any injuries that may have been done in the course of the events that led to this decision."^[17]

Nixon stated that he was leaving office the following day, because his "political base in the Congress" was gone. His letter of resignation, dated August 9, 1974, was addressed to the Secretary of State, Henry A. Kissinger, and read simply, "I hereby resign the Office of President of the United States."^[18]

Gerald Ford became the 38th president and the first to assume the presidency by virtue of the 25th amendment. By signing Proclamation 4311 on September 8, he exercised his constitutional authority (Article II, Section 2) to grant pardons. The authority to grant pardons does not extend to cases of impeachment. President Ford granted Nixon a "full, free, and absolute pardon."^h

Among the reasons Ford gave as the basis for his decision to grant a pardon were his understanding of his constitutional duties; his conscience; his religious beliefs; and values such as mercy and justice. He also stressed the public good that was otherwise threatened by political polarization, perhaps even paralysis, along with the reduced credibility of governmental institutions, were Nixon subjected to a long criminal trial. (See Fig. 2.) Speaking to the House Judiciary Committee on October 17, Ford further explained that "a government which deceives its supporters and treats its opponents as enemies must never, never be tolerated."

Shortly after pardoning Nixon, in an act of reconciliation that supported his explanations, President Ford proclaimed an amnesty for those who had evaded military service during the war in Vietnam. Ford's standing in opinion polls suffered from the pardon and the amnesty, and he lost his bid for re-election.

^fIn a move heavy with symbolism, President Reagan appointed Senator Baker as his chief of staff in response to the Tower Commission's investigation of the Iran-Contra affair.

^gThe Senate convicted neither President Andrew Johnson in 1868 nor President William Jefferson Clinton. To date, no U.S. president has been convicted.

^hThe complete text of President Ford's statement is available at the Gerald Ford Library at <http://www.ford.utexas.edu>, accessed August 2001. President Ford received the John F. Kennedy Profile in Courage Award in 2001 for pardoning Nixon. See Ref. ^[19].

In all of the decisions I have made in my public life, I have always tried to do what was best for the Nation. Throughout the long and difficult period of Watergate, I have felt it was my duty to preserve, to make every possible effort to complete the term of office to which you elected me

In the past few days, however, it has become evident to me that I no longer have a strong enough political base in the Congress to justify continuing that effort....

I would have preferred to carry through to the finish whatever the personal agony it would have involved, and my family unanimously urged me to do so. But the interests of the Nation must always come before any personal considerations....

I have never been a quitter. To leave office before my term is completed is abhorrent to every instinct in my body. But as President, I must put the interest of America first. America needs a full-time President and a full-time Congress.... To continue to fight through the months ahead for my personal vindication would almost totally absorb the time and attention of both the President and Congress in a period when our entire focus should be on the great issues of peace abroad and prosperity without inflation at home

Therefore, I shall resign the presidency effective at noon tomorrow. Vice President Ford will be sworn in as President at that hour in this office

As we look to the future, the first essential is to begin healing the wounds of this Nation; to put the bitterness and divisions of the recent past behind us and to rediscover those shared ideals that lie at the heart of our strength and unity as a great and as a free people

By taking this action, I hope that I will have hastened the start of that process of healing which is so desperately needed in America.

I regret deeply any injuries that may have been done in the course of the events that led to this decision. I would say only that if some of my judgments were wrong, and some were wrong, they were made in what I believed at the time to be the best interest of the nation....

Fig. 1 Excerpts from President Richard M. Nixon's resignation speech, August 8, 1974.

IMPACT

Watergate's most notable impact was the president's resignation. About 40 government officials eventually were indicted in proceedings related to Watergate; some served prison terms and others were dismissed, fined, or disbarred. The affair's successive revelations, duration, and aftermath profoundly affected the federal government beyond the White House:

While White House staff, senior political appointees, and members of a political campaign committee were heavily implicated and ultimately prosecuted, the federal bureaucracy was deeply affected as well. The Internal Revenue Service, Federal Bureau of Investigation, Central Intelligence Agency, and the Department of Justice suffered the impact of manipulated operations, suspicion, and illegal obstruction of justice and cover-up. Allegations and investigations riveted attention and absorbed administrative resources. Executive decisions were hard to come by and much of the non-routine business slowed to a standstill.^[3]

While elected and appointed officials were involved, not civil servants, neither the U.S. Civil Service

Commission nor human resources managers protected the career civil service.^[20]

Public opinion registered a considerable decline in confidence and trust in government. The affair also expanded the "popular conception of what constituted governmental corruption" to include waste and abuse, as well as more traditional focus on fraud.^[20] Measures designed to ameliorate these impacts were taken. "Largely driven by the revelations of Watergate, lawmakers in the 1970s passed a series of 'good government' bills designed to repair the political process and rejuvenate public confidence in their elected officials."^[21] In the aftermath of Watergate, 19 states adopted codes of conduct. The American Bar Association adopted an accreditation standard for instruction in legal ethics in 1974.^[9] The 1974 elections swept 92 new members into the House of Representatives and 11 new members to the Senate. Both chambers adopted codes of conduct in 1977 that ended office "slush funds," restricted outside income, limited lobbying by former members and staffers, and more. In 1978, the U.S. Office of Government Ethics was established; the 1978 Ethics in Government Law established what later became the controversial office of the independent counsel.^[22]

I have come to a decision which I felt I should tell you and all of my fellow American citizens, as soon as I was certain in my own mind and in my own conscience that is the right thing to do....

My customary policy is to try and get all the facts and to consider the opinions of my countrymen and to take counsel with my most valued friends. But these seldom agree, and in the end, the decision is mine....

I have promised to uphold the Constitution, to do what is right as God gives me to see the right, and to do the very best that I can for America....

The Constitution is the supreme law of our land and it governs our actions as citizens. Only the laws of God, which govern our consciences, are superior to it....

Theirs [Nixon and his family] is an American tragedy in which we all have played a part. It could go on and on and on, or someone must write the end to it. I have concluded that only I can do that, and if I can, I must....

I deeply believe in equal for all Americans.... The facts, as I see them, are that a former President of the United States, instead of enjoying equal treatment with any other citizen accused of violating the law, would be cruelly and excessively penalized....

During this long period of delay and potential litigation, ugly passions would again be aroused. And our people would again be polarized in their opinions. And the credibility of our free institutions of government would again be challenged at home and abroad....

As President, my primary concern must always be the greatest good of all the people of the United States whose servant I am. As a man, my first consideration is to be true to my own convictions and my own conscience....

My conscience tells me it is my duty, not merely to proclaim domestic tranquility but to use every means that I have to insure it. I do believe that the buck stops here, that I cannot rely upon public opinion polls to tell me what is right. I do believe that right makes might and that if I am wrong, 10 angels swearing I was right would make no difference....

Now, therefore, I, Gerald R. Ford, President of the United States, pursuant to the pardon power conferred upon me by Article II, Section 2, of the Constitution, have granted and by these presents do grant a full, free, and absolute pardon unto Richard Nixon for all offenses against the United States which he, Richard Nixon, has committed or taken part in during the period from July (January) 20, 1969, through August 9, 1974....

Fig. 2 Excerpts from President Ford's explanation to the public of his pardon of Richard Nixon, September 8, 1974.

LEGACY

President Nixon asked in his televised speech on April 30, 1973, "How could it have happened? Who is to blame?" An answer is needed to begin to understand the cause(s) or at least the seeds of Watergate and to take measure of its legacy. A good part of the answer lays in the organizational culture induced or condoned by the president, his appointees, and his staff, to which they fell prey. An historian likened the culture to a "cult of personality" in which "loyalty to the leader seemed to override everything else."^[23] They were inadequately prepared for their stature and task, too easily tempted by power, and then overwhelmed by it.^[9]

At the request of a Senate committee, a panel of the National Academy of Public Administration produced a report in which was described a climate of zealotry

characterized by ideological commitment to a particular president and his policy rather than by judicious commitment to the office.^[24] In his April, 1973, speech, Nixon expressed a similar view by describing subordinates as "people whose zeal exceeded their judgment and who may have done wrong in a cause they deeply believed to be right." "It appears that conviction preempted judgment and loyalty trumped competing ethical claims in this White House."^[3]

The *Washington Post*, commemorating in June, 1997, the 25th anniversary of the burglary, described Watergate as the "most famous political scandal in American history." While that may prove a temporary designation, it surely left a lasting mark on the American polity and society. "Watergate continues to reverberate through politics and journalism as the scandal and investigative story against which all others

are measured.’’^[25] Watergate was the backdrop against which were viewed the Iran-Contra scandal and scandals surrounding President Clinton’s Administration. The boundaries between public and private behavior shrank as media standards for public disclosure shifted, along with public expectations. A culture of scandal and scandal-mongering changed the nature of the presidency and its relationship with the media, Congress, oversight and investigative offices, and the public.^[26]

“The events and repercussions collectively called Watergate symbolize breaking faith, breaking trust, and breaking laws” and evolved into a symbol of abuse of public office and deception.^[3]

It was a test of the American political system, and perhaps its greatest test. But it fell short of a constitutional crisis and instead demonstrated the strengths of the system. Nixon offered this assessment in his speech in April 1973: “Some people, quite properly appalled at the abuses that occurred, will say that Watergate demonstrates the bankruptcy of the American political system. I believe precisely the opposite is true. Watergate represented a series of illegal acts and bad judgments by a number of individuals. It was the system that has brought the facts to light and that will bring those guilty to justice.” Twenty-five years later, Bob Woodward agreed with the central proposition (if not with the identity of the guilty) and said, “I believe Watergate shows that the system did work.’’^[27] Nevertheless, the public’s trust in government and idealism about politics and political leaders were severely shaken by the Watergate scandal that left an indelible mark on American public life.

Welfare and Social Security Policy

Mark Carl Rom

*Georgetown Public Policy Institute (GPPI), Georgetown University,
Washington, District of Columbia, U.S.A.*

INTRODUCTION

The U.S. government provides income support to citizens in two main ways: social insurance and public assistance. (The best single source of program descriptions and data for both types is the *Green Book*.)^[1] Social insurance programs provide benefits to those who qualify by virtue of having contributed through taxes to the program. The largest social insurance programs are social security, which primarily affords pensions to the elderly; Medicare, which supplies health insurance to the elderly; and unemployment insurance (UI), which provides cash benefits to those who have temporarily lost jobs. Public assistance—colloquially called “welfare”—comprises various programs that provide support to the poor. The federal welfare system includes Temporary Assistance to Needy Families (TANF), Food Stamps, Medicaid, Supplemental Security Income, and child nutrition programs, among numerous others. Together, these programs provide cash benefits, health insurance, housing, job training, and other social services to those in poverty.

Social insurance and welfare have different purposes, serve dissimilar groups, and witness divergent politics. After a brief introduction to the distinction between social insurance and public assistance, this article focuses on the policies and politics of social security, the largest social insurance program, and TANF, the most controversial of the public assistance programs.

BODY

Social insurance and public assistance (welfare) programs are distinct in several ways. First, welfare programs are “means tested”—that is, persons can qualify for public assistance only if their income and assets are below programmatic thresholds. These programs explicitly exist to assist the poor. Social insurance programs, in contrast, make benefits available to anyone who has contributed through taxes to the program and has become eligible to receive payments from it; eligibility is determined primarily by

age, for social security and Medicare, and loss of employment, for UI. Social insurance programs are not means tested, so benefits are available to recipients regardless of their income. Second, welfare programs are designed primarily to help those who are incapable of supporting themselves and their families through work. (Determining exactly who can and should be expected to work is usually controversial, however.) Social insurance, in contrast, is to support workers from the loss of income due to age, illness, or job loss. Third, social insurance programs are broadly popular, in part, because they are seen to offer benefits to those who “deserve” them: those who have contributed to the program, the temporarily unemployed, the elderly—and the vast majority of Americans will fall into at least two of those three categories during their lifetimes. Public assistance is far more controversial, for a couple reasons. Although the public shows broad support for helping the “truly needy,” large proportions of the public believe that welfare recipients are lazy, shady, and dependent, and hence undeserving of governmental support.^[2] Moreover, a substantial majority of the public never receives welfare benefits and so apparently believes it has little self-interest in supporting such programs. Finally, as a disproportionate segment of the poor are racial and ethnic minorities, especially African Americans and Hispanics, welfare programs are often seen through racial stereotypes.^[3]

Origins of Social Security and Welfare

Prior to the 1930s, individuals and families were expected to fulfill their own economic requirements, supplemented in times of need by charities or local governments. The onset of the Great Depression pushed millions of Americans into destitution, swamped charitable and local efforts at remedy, and raised questions about the future of capitalism. To address all three concerns, in 1934, President Franklin Roosevelt appointed the Committee on Economic Security (CES) to develop comprehensive legislation to enhance “the security of men, women and children of the Nation

against certain hazards and vicissitudes of life.’’^[4] The legislation the CES proposed contained social security, UI, and Aid to Dependent Children [ADC, which later became Aid to Families with Dependent Children (AFDC) and, in 1996, transformed into TANF], among other programs to assist the blind and disabled. Congress swiftly enacted this legislation as the Social Security Act in 1935. This act continues today as the basis for social security and welfare.

Social Security

As the Great Depression wiped out the life savings of many elderly, leaving their children unable to provide for them, social security was conceived of as an insurance program that would nonetheless begin immediately providing cash benefits to the elderly. Social security has been periodically revised, with most of the initial revisions expanding eligibility and increasing benefits. Originally covering just over one-half of the workforce (those employed in commerce and industry), by the late 1990s, social security covered approximately 96% of all workers, with the main exceptions being those employed by state governments and some federal employees. By 2000, social security paid out about \$387 billion in benefits to the retired, the disabled, and those eligible by the death of an insured worker. It was the most expensive federal program.^[5]

Social security establishes eligibility and benefits in the following way. All “covered” workers pay taxes on a fixed proportion (6.2%) of their wages or salary up to a fixed limit (\$76,200 in 2000). The employer contributes the same proportion to the same limit. Benefits are paid to workers when they retire or become disabled if they have worked (i.e., contributed) long enough. Although the formula varies, persons become “fully covered” (i.e., insured for life) when they have earned one quarter of coverage each year from when they turn 21 until they reach 62 (40 quarters); workers are insured against disability if they have worked at least 20 of the last 40 quarters.^[1]

Workers are eligible for benefits if they retire at age 62, but can receive larger monthly benefits if they defer retirement until age 65 (or, in the future, later). Benefits are calculated based on a formula accounting for the worker’s lifetime “covered” earnings. The formula is fairly complex (based on such factors as when a worker started employment, as well as the duration and continuity of wages), but the essential ideas are these: the longer one has worked and the higher one’s wages, the greater the social security benefit. Benefits are indexed to inflation. There is a special minimum benefit awarded to those who worked many years at very low

wages. For those with relatively high postretirement income, one-half of the social security benefits are subject to income taxes.^[1]

Social security has as one of its primary goals the reduction of poverty among the elderly. To achieve this goal, those with lower wages receive relatively higher social security benefits. For instance, in calculating a person’s benefits, in 2000, social security “replaced” roughly 90% of the first \$531 in monthly earnings, 32% of the next \$2671, and 15% of the rest. Individuals thus received a higher proportion of their preretirement income the lower their wages; they received a higher dollar amount, the higher their income while working.^[1]

Workers’ contributions are not contributed to individual accounts, which means that workers are not literally saving for their retirement; they are paying into a program that will support their retirement. Most revenue collected goes immediately out to pay the benefits of current recipients; the remainder forms one large pool of money, called the Trust Fund. The Trust Fund is invested in government securities (i.e., the government purchases its own bonds), where it earns the prevailing rate of interest on such bonds. The Trust Fund is not invested in a tangible asset, but in an IOU the government has written to itself.^[1]

Social security has long been considered the “third rail” of American politics—touch it and you die. In general, the elderly depend on social security, they believe they have earned its benefits, and they believe it is nearly a sacred contract with the government. Moreover, the elderly vote at higher rates than the public as a whole. It has always been much easier to expand the program than contract it. Politicians who are perceived as willing to tampering with social security often face retribution on election day. The Democratic party, which has traditionally been seen as the main defenders of social security (as it was created by a Democratic president and a Democratic Congress), routinely pillories the Republican party as a threat to the program.

The political untouchability of social security may be changing. The reasons for the change are demographic, economic, and ideological. The demographic and economic reasons are linked. In the coming decades, the American public will grow substantially older on average; the ratio of those retired to those working will shift from about 1 in 5 to 1 in 2.5.^[6] As a result, there will be far fewer workers to pay social security taxes and far more recipients obtaining benefits (Fig. 1). This means that the costs of the program are likely to rise substantially, and the revenue raised to fund it will not keep pace. The Social Security Administration estimates suggest that the Trust Fund will be running an annual deficit (i.e., more is paid out in a given year than is raised) beginning about

Fig. 1 Social security income, outflow.

2030 or so (depending on many assumptions), and will begin incurring debts (i.e., the Trust Fund will be exhausted) by around 2040.^[6] Although some might argue that the social security system is going bankrupt, it is virtually unthinkable that the federal government would default on its obligations.

Nonetheless, given current projections, most analysts agree that, at some point, either taxes must be raised, benefits reduced, or the retirement age must be raised, unless some way can be found to increase the rate of return on revenue brought into the Trust Fund.^a Raising the rate of return seems to be the most attractive choice politically, as it is the only one that appears not to hurt anyone. The rate of return could conceivably be increased if some or all the Trust Fund was invested in non-governmental assets (i.e., stocks, commercial bonds, etc.), or if individuals could directly invest some of their contributions in such assets. Those holding a promarket ideology certainly favor such options, and plans to privatize social security have become more reputable in recent years. Critics raise three main objections to privatization: 1) the transition

from the current pay-as-you-go system to a privatized system would be costly; 2) higher administrative costs would probably erode the higher returns; and 3) higher returns would come only with (unacceptably) higher risks to the beneficiaries.

One political dilemma is that the program's long-term financial difficulties will be easier to fix technically (i.e., smaller changes will be required) the sooner they are addressed. Yet, as long as the financial problems seem far in the future, the political incentives to face them now are fairly weak. Unfortunately, the longer policy makers wait to address the problems, the larger they are likely to become, and the harder the political choices will be.

TANF

TANF's predecessor, AFDC, was created as a minor and uncontroversial element of the original Social Security Act. Aid to Families with Dependent Children was designed to provide cash benefits to families where the father had died or was otherwise absent from the home. The federal government set broad program standards and provided a majority of the funding, but left program administration to the states. The states established a eligibility criteria, set benefit levels,

^aProjecting the long-term future (e.g., 30 or more years from now) is fraught with uncertainties regarding demographics and economics. For various assumptions and the wide variation in the state of the economy and social security, see Ref.^[7].

and contributed a portion of benefit payments. Eligibility, benefits, and participation varied widely from state to state.^[8]

Aid to Families with Dependent Children was intended to be a temporary program providing income support to widows and their families. It did not turn out that way, however. Fifty years after its creation, AFDC provided assistance to more than 14 million Americans. The vast majority of the parents it assisted were not widows, but parents who were divorced, separated, or never married. Only a small percentage of the mothers receiving AFDC had paid employment, even though by the 1990s, most other mothers did earn income by working. (Aid to Families with Dependent Children did have a work element, the so-called “JOBS” program, but only about 10% of AFDC adults actually participated in it.) At any given time, almost two-thirds of adults receiving AFDC had been “on the dole” for 8 or more years. Finally, almost two-thirds of the recipients were non-white minorities.^[1] In short, a large proportion of adult AFDC recipients were minority single mothers with little earned income who remained on the rolls for years. For these reasons, AFDC came to be seen as a program that discouraged marriage and work, encouraged out-of-wedlock childbearing and dependency, and primarily served minorities. The critics of AFDC held that welfare recipients became dependent on the government because, in part, the government did little to encourage independence.

Presidents since Nixon had called for major restructuring or elimination of AFDC, and President Clinton’s most popular campaign pledge was to “end welfare as we know it.” In 1996, a Republican-controlled Congress took the President at his word and enacted legislation that eliminated AFDC and created TANF in its place; President Clinton, against the advice of his more liberal advisors, signed the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) into law.^[2]

Temporary Assistance to Needy Families differed from AFDC in several important ways. (Program details are summarized in the *Green Book*).^[1] First, it eliminated the individual entitlement to benefits. Poor families would no longer be guaranteed benefits because the states were given authority to decide which families were eligible, to divert families from entering TANF or to sanction those already receiving benefits. The law also set a 5-year lifetime limit on individuals receiving federal benefits (although 20% of a state’s caseload may be exempt from this provision due to “hardship”). Second, it made work, rather than income support, the primary focus of the program. To encourage work, PRWORA set a specified and gradually rising proportion of each state’s welfare

caseload that must be working at least 30 hours per week. The law required that beneficiaries be working within 2 years of obtaining benefits, and allowed states to set shorter time limits. (Wisconsin, for example, requires potential beneficiaries to be engaged in work efforts before they receive their first benefit check.) Third, PRWORA gave the states substantially more flexibility to design and implement TANF; the law allowed the states to delegate responsibility to the counties (e.g., as California has done). The law also eliminated open-ended funding to the states by providing them a fixed-amount block grant each year from 1997 to 2002 (funding levels must be reauthorized in 2002). States, for their part, had to spend at least 75% as much on welfare as they were when PRWORA was enacted. Personal Responsibility and Work Opportunity Reconciliation Act did authorize certain bonus payments to the states if they, for example, reduced non-marital birth rates while also reducing abortion rates.

Temporary Assistance to Needy Families impact on welfare caseloads is nothing short of astonishing. Although caseloads had already begun shrinking by 1994, by the end of 2000, the number of individuals enrolled in TANF had fallen by almost 60% from its all-time high (Fig. 2). In 2002, there are fewer families receiving welfare than at any time since the 1960s. There is substantial debate regarding the relative weight of economic conditions and TANF implementation on caseload declines, but by all accounts both have played substantial roles. The greatest change in welfare policy in 60 years occurred in a uniquely favorable economic climate.

Temporary Assistance to Needy Families has also increased the work effort of those on welfare and potentially eligible for it. By 1998, approximately 35% of those enrolled in the program were meeting their 30 hour per week work requirements, up from about 5% in the early 1980s. The true impact of the program on employment is not known, in large part because a substantial portion of the AFDC caseload apparently was working off the books, and also because the program does not track the work effort of those diverted from the program or those who are eligible but have not applied.

Perhaps the most controversial question regarding TANF has been its impact on poverty rates and the income of the poor, especially given the positive economic conditions of the late 1990s. Some substantial fraction of families that had been eligible for AFDC had improved incomes after TANF was implemented, primarily because they had found unsubsidized employment in the private sector. It appears that a smaller portion were worse off because they received smaller benefits, or had been driven off the rolls and

Fig. 2. AFDC/TANF caseloads.

had not found employment. A large segment of the AFDC population's income did not change much under TANF.^[9]

Both Democrats and Republicans accept TANF's basic structure, and no major voices call for a return to AFDC. The major controversies concern work requirements, funding, and moral provisions. The Bush administration and Republicans in Congress have called for increasing the proportion of the caseload that must be working, and the number of hours they must work weekly. Democrats (and most governors) find these provisions unduly onerous. Regarding funding, those who prefer cuts focus on the major declines in the caseloads; those who favor increased (or at least level) funding contend that the remaining caseload is more expensive to serve. Finally, the Bush administration has called for TANF funding to promote marriage. The public strongly values marriage as an institution, but is strongly skeptical of the government's need or ability to promote it.

CONCLUSION

Social security is the largest and most important social insurance program. It has been a tremendous success economically, socially, and politically because it has

helped millions of elderly (and disabled) Americans to have a decent income after their working years have ended. Social security has substantially lowered the poverty rate among the elderly and has provided generations of Americans the confidence of having a financially secure retirement. However, it does face challenges for the future.

Welfare programs have been much smaller and more controversial. Aid to Families with Dependent Children was widely seen as a failure by liberals because it provided scant support for the poor and by conservatives because it encouraged dependency. Although many analysts viewed systematic reform as nearly impossible, the creation and implementation of TANF as AFDC's replacement is commonly interpreted as a major political and programmatic success. Whether TANF can be modified and sustained in ways that keep caseloads low while also reducing poverty among families remains an open question.

Welfare Economics

Glenn A. Daley

RAND Graduate School, Santa Monica, California, U.S.A.

INTRODUCTION

Welfare economics is the study of how economic well-being is (or is not) advanced by markets, and thus by government intervention in markets. To some, this implies a value judgment inconsistent with the ideal of scientific objectivity. One way to approach this is by analogy with the field of medicine: just as understanding the body helps in prescribing actions that contribute to health, understanding how the economy works helps in prescribing policy. Nevertheless, it is useful to remember the differences between understanding why something happens, analyzing the consequences of proposals, and making values-based recommendations. In economics, an example of the first would be explaining why the price of gasoline rises and falls; the second would be predicting the consequences of a price ceiling on gasoline; and the third would be recommending for or against a price ceiling based on criteria such as efficiency or fairness.

Welfare economics includes all three of these pursuits, but ultimately aims toward the third. Its method is to make assumptions about well-being and then to explore the implications of these assumptions: 1) by raising questions about the assumptions in an attempt to keep them limited, flexible, consistent, compatible with experience, and yet capable of generating useful results; and 2) seeking to identify areas where the real world does not match the assumptions of the model, areas where other values might be accommodated without abandoning the model, and areas where the methods gained from the model are valid enough to use in the real world. Welfare economics provides the foundation for the applied discipline of benefit-cost analysis.

WELFARE AND UTILITY

The first task for welfare economics is to define economic welfare for an individual. Although economists may disagree on exactly where to draw the line, there is widespread agreement on the basic approach described here (which we refer to as the “standard model”). This model only applies to goods and services that are, or potentially could be, obtained from

other people or provided to other people, whether as a gift, for money, through barter, or in some implied quid pro quo arrangement. (Hereafter, “goods” refer to such goods and services, understood broadly to include leisure time and other things that might be given up for something else.) To simplify the mathematics, we assume that people prefer more of these goods to less; in the case of a preference for less of something (e.g., air pollution), the absence of the thing may be treated as a good. Furthermore, each person may have different preferences between goods, so individual welfare is based on a person’s unique set of preferences. This is consistent with the tradition of democratic individualism in allowing everyone to decide for themselves what constitutes their own well-being (with exceptions, such as parents deciding for children).

Thus, in one sense, an individual’s economic well-being is whatever value, satisfaction, or happiness that the individual receives (or expects to receive) from economic goods as defined above. The word “utility” is used to identify this kind of well-being. This definition makes contemporary economists uneasy, though, because it is based on subjective effects such as “satisfaction” rather than on observable behavior. Thus, the definition used today is that utility is the unobserved content of an individual’s preferences. Although preferences are subjective, in principle they may be revealed in a person’s choices—without any further guessing about the person’s emotional state or degree of happiness. So utility is whatever it is that people prefer more of when they show preferences between goods; this provides a highly flexible definition of welfare that defers moral and subjective judgments to the individual rather than to the economist.

Given this concept of individual utility, what is the economic well-being of society as a whole? In the utilitarian tradition, society’s welfare is defined as some aggregate of individual utilities. This means that any values that apply to the community as a whole, completely independent of the utilities of the members of the community, are excluded. This is not to deny their validity or importance; it is only to say by definition that they are not the same as economic welfare. However, some of the community-level values that people care about, such as equity in the distribution of wealth,

may still be accommodated in an economic model through a social welfare function, such as the weighting of individual utilities.

The concept of aggregate utility raises the question of how to combine and compare individual utilities. Early welfare economists attempted to define utility in a way that could potentially be measured and summed together on a cardinal scale (i.e., a measurement system with countable units that are equal and comparable to each other), just as the aggregate weight of passengers on an airplane is the sum of the individual weights. This proved to be a difficult concept; it requires a standard unit of measurement and a zero point on the scale, and it assumes that utility can be compared between people. If my utility and yours are to be added together, then some third person must, in principle, be able to tell whether you have more utility than I do. This leaves the door open for some person or institution to take on the paternalistic role of defining utility for you and me, something we want to avoid. Because of these difficulties, the assumption of cardinal utility—the basis of “old welfare economics”—has been abandoned.

The “new welfare economics” is based on the ordinal concept of utility, the idea that utility levels can be ordered or ranked by an individual, even though they might not be measurable in additive units. This is consistent with the definition of utility as a matter of preferences. The question is not how much utility a person gets from a bundle of goods, but whether the person prefers one specific bundle in comparison to another specific bundle.

Ordinal utility is identified by pairwise comparisons between alternative bundles of goods. For every possible pair of bundles, which we can label as X and Y, a person either prefers X, prefers Y, or is indifferent between X and Y. The map of all these pairwise preferences defines utility for an individual. If people prefer X to Y, we say that their welfare, or utility, is greater from getting X than from getting Y, and, if they have the opportunity to exchange X for Y, they will voluntarily do so, thereby obtaining an increase in utility.

THE PARETO CRITERION

The ordinal concept of utility still does not tell us how to think about society’s welfare because it cannot be added between individuals. The answer is to concentrate on changes in utility at the margin (i.e., preferences between a change and its absence). A transaction or a policy decision might make one individual better off (or worse off) in terms of that person’s preferences, but the same event might affect other people in different ways. For instance, a policy that takes goods from me and gives them to you would clearly reduce

my utility, and increase your utility. So far, we cannot tell whether your gain is greater than my loss; we might have different preferences for these goods in the context of the other goods we have. So, this example is ambiguous in its effect.

However, we can imagine an event that unambiguously represents an improvement in society’s welfare. Suppose I have bundle X but prefer Y, and you have bundle Y but prefer X. I can increase my own utility, and you can increase yours, by swapping. Because both of us are better off, and assuming no one else is made worse off, we have increased society’s welfare without having to add or compare utility between individuals. An event improves the welfare of society if it makes at least one person better off in terms of that person’s preferences, and does not make anyone else worse off in terms of their own preferences. Such a change is called a Pareto improvement, after Vilfredo Pareto, the nineteenth-century Italian social scientist who first stated this rule. In terms of economic welfare defined as preference-based utility, Pareto improvements are unquestionably desirable.

The Pareto rule might seem too restrictive because nearly any policy change will make some members of society worse off. However, the losers might be compensated. If person A gains from a change, and person B loses, perhaps A’s gain is large enough that A is willing to pay B for the loss. As long as A prefers or is indifferent to the change even after making this payment, and B prefers or is indifferent to the change conditional on receiving the payment, no one has suffered a net loss of utility, and the Pareto rule is satisfied. This sort of compensation occurs all the time in private market transactions; in public policy, though, such payments are sometimes outlawed as “bribes.” Still, it is often possible to design policy programs to include such compensation, and thus satisfy the Pareto criterion. Yet, the Pareto criterion is never satisfied when the winners do not gain enough to compensate the losers.

Suppose a point is reached where no more Pareto improvements are possible; society has exhausted every opportunity to increase anyone’s welfare without reducing the welfare of someone else. Such a point is called a Pareto-optimal point, or a Pareto-efficient point. However, there are many possible Pareto-efficient points, not all of which are equally achievable or desirable. The set of all Pareto-efficient points is an important concept in theory, but practical policy-making focuses on making continuous Pareto improvements rather than formally defining the end state. The Pareto criterion is neither sufficient nor necessary for ethical judgments about society’s well-being, but it does establish a benchmark: it places the burden of justification on any policy proposal that violates it, and lends support to any policy proposal that satisfies it.

COMPETITIVE MARKET OUTCOMES

To apply the Pareto criterion to economic outcomes, we need to identify what we mean by a competitive market equilibrium. This occurs when supply and demand are in balance, and markets clear. In other words, there is no unmet or excess demand at the market price, and no unused or excess supply at that price. If the market is perfectly competitive, then every participant is a price taker; everyone faces the same prices for the same goods, and no one buys or sells enough to influence prices. Market prices (and, thus, quantities bought and sold) are determined by supply and demand.

Both supply and demand depend on the utility-seeking efforts of many individuals. Consumers seek to maximize utility by purchasing goods; they are constrained, however, by a budget—their available income or wealth. As long as goods have prices, reflecting the fact that others also want them, one cannot obtain them without giving up something. Given a certain set of prices and a certain income or wealth constraint, a person will choose the quantities that maximize total utility. Across all individuals, these are the quantities demanded in the market.

Likewise, goods are provided by firms or individuals who want to maximize their net gain by selling. We commonly assume that firms seek to maximize money profits, which are simpler to calculate than utility. However, firms' costs depend on the hired labor of utility-seeking workers, and some firms operate as though pursuing other goals or utilities, rather than simple profits. So, utility maximization is essential to supply as well as demand. At a given set of prices, firms and individuals will supply the quantities that maximize their own utilities (or profits).

One of the mathematical results of welfare economics^[1–3] is that, given some basic assumptions about the competitiveness of markets and the rationality of preferences (“rationality” referring to consistency in how preferences relate to each other, *not* whether the preferences themselves are based on “reason”), a person will buy quantities of goods such that the marginal utility of each good—the contribution to utility of the last unit purchased—is proportional to its market price. (If utility can be measured in monetary terms, we might even say that the marginal utility is equal to the price. This is a simplification; in terms of preferences, the person is indifferent between having one more unit of a good and using the same money toward buying one more unit of a different good.) Another result of these assumptions is that a firm will sell quantities of goods such that the marginal cost of each good—the contribution to cost of the last unit sold—is equal to its price. As a result, goods are produced and purchased in just the right quantities so that the

marginal utility of *each* good to *each* consumer is exactly proportional (or equal) to its marginal cost to society of production, across all goods and consumers.

In the short run, when goods are bought and sold from existing inventories (or existing workers' available time and skills, in the case of services), a market simply consists of buying and selling decisions. Over time, though, more or less of each good may be produced, so a market equilibrium also comes to represent the cumulative production decisions of firms; thus, it determines the allocation of society's resources between the various goods possible. As a result of utility and profit seeking, this equilibrium allocation represents the production level of each good where the marginal cost equals the price and, thus, the marginal utility to consumers. A competitive market equilibrium provides the best possible match between the allocation of resources to the production of goods, and the preferences and budget constraints of all consumers.

THE FIRST FUNDAMENTAL THEOREM

The First Fundamental Theorem of welfare economics says that any such perfectly competitive market equilibrium is in fact a Pareto-efficient allocation (given certain assumptions). This can be proven mathematically,^[1] but it can also be seen by intuitive reasoning. It is a later version of Adam Smith's idea that society's welfare is promoted by the market's “Invisible Hand.”

Welfare economics assumes that, if given the opportunity, people will always exchange goods they possess but do not prefer for goods that they prefer but do not possess; however, a voluntary exchange will *not* occur if one of the parties is made worse off by the transaction. (Here, we ignore asymmetric information, risk, and derived utilities, such as the satisfaction of giving. Such complexities can be added later as extensions of the model or recognized as violations of the assumptions.) Thus, a voluntary exchange transaction is a Pareto improvement. Assuming that all people who have or want exchangeable goods at the same price can find each other, and firms are able to sell all they make at this price, the resulting allocation must be Pareto efficient.

The analysis of markets in terms of Pareto efficiency can be illustrated with a graphic device called the Edgeworth box, shown in Fig. 1. This represents a simplified economy in which there are only two persons and two goods, and all goods must be held by the two persons. The axes represent quantities of goods X and Y held by persons A and B, with A's holdings increasing up and to the right, and B's holdings increasing down and to the left. The curves in the graph are indifference curves; each one represents a set of combinations of X and Y that an individual is

Fig. 1 Edgeworth box with indifference curves. A prefers D to either E or F; is indifferent between E and F; prefers E or F to G or H; and is indifferent between G and H. B prefers H to either F or G; is indifferent between F and G; prefers F or G to D or E; and is indifferent between D and E.

indifferent among. The convexity of these curves is based on certain assumptions about the rationality of preferences, and the observation that people generally prefer mixed combinations of goods rather than having all of one thing and none of another (again, a simplification; for more, see Refs.^[1,2,4]). There is an infinite number of indifference curves, or at least enough so that every possible point (X,Y) lies on *one and only one* indifference curve for each person.

Assuming goods cannot be held by both persons, the only way to increase one's utility is to exchange goods, but an exchange must be agreeable to both. So each person faces a constraint. What is the highest utility possible for one person with the other person's utility fixed? In Fig. 2, with person B's utility fixed at curve P, person A achieves the highest possible utility on curve R, which touches curve P at only one place: point K, where the two curves are tangent. Mathematically, this is where the local slopes (or derivatives) of the two curves are equal. This is another way of saying that the rate at which A is indifferent to giving up the last unit of X for another unit of Y is exactly equal to the rate at which B is indifferent to giving up the last unit of Y for another unit of X. The set of all such points where indifference curves are tangent is called the contract curve; whenever the two parties are not on that curve, they will exchange goods until, and only until, they reach a point on it. This curve represents the combinations of X and Y at which both people will be unable to achieve any more gains through exchange;

Fig. 2 Edgeworth box with contract curve. With B's utility fixed on indifference curve P: A cannot achieve utility on curve Q because B will not agree. A will not agree to utility curve S because R is better. The highest utility for A (that B will agree to) is on curve R. And the only place on curve R that A can achieve is at point K, where curve R is tangent to curve P. The set of all such tangent points is the contract curve.

once on that curve, they will not mutually agree to move off of it.

The First Fundamental Theorem says that all the points on this contract curve are Pareto efficient points. Any final outcome produced by voluntary exchange between individuals will be a Pareto-efficient point. This simple result can be extended mathematically^[1] to a competitive market of many individuals and firms that produce, sell, and buy goods for money at market prices rather than merely swapping; any such allocation is Pareto efficient.

The First Fundamental Theorem requires some strong assumptions about the market: 1) No third party can be involuntarily affected. If a third party is harmed without compensation, the Pareto criterion is not satisfied, and the price does not equal the marginal cost to society. 2) If a third party stands to gain from a potential transaction that does not take place in sufficient quantity because the primary parties are satisfied with their outcomes, then all possibilities for Pareto improvements have not been achieved, and the marginal benefit for society does not equal the price. These third-party effects are called externalities or public goods, and they violate the assumptions of the theorem. The mathematical proof of the theorem across many buyers and sellers also requires assumptions about the market: 3) All parties are price-takers (i.e., everyone pays the same price because of free

competition), and no one has the power to affect the market price as a monopoly does. 4) Buyers and sellers have all the information and power they need to locate each other, to assess the value of goods, and to make enforceable contracts. Where any of these four assumptions are violated, the outcome may not be a Pareto efficient allocation.

THE SECOND FUNDAMENTAL THEOREM

While the First Fundamental Theorem states that every competitive market equilibrium is Pareto efficient, the Second Fundamental Theorem of Welfare Economics asserts that every possible Pareto-efficient point can be reached by a competitive market from some initial distribution of wealth. Any point not on the contract line provides an opportunity for the parties to make an exchange that will move one or both of them to a higher utility (a more preferred indifference curve), without causing either of them to move to a lower utility. Clearly, which points can be reached depend on the initial distribution. In Fig. 3, point M^* can be reached by Pareto improvements from any point in the region M_0 , whereas point N^* can be reached by Pareto improvements from any point in the region N_0 .

One criticism of the Pareto rule is that it is too conservative because it limits the range of acceptable

Fig. 3 Pareto improvements from initial endowments. Point M^* is a Pareto-efficient point that can be reached by Pareto improvements from any initial endowment in region M_0 . Point N^* is a Pareto-efficient point that can be reached by Pareto improvements from any initial endowment in region N_0 .

changes to those that can be achieved from the status quo distribution of wealth. Even though an endowment might have resulted from previous events that harmed people and failed the Pareto criterion, any present action to redress the historical harm is likely to reduce someone's current welfare and fail to satisfy the criterion. Even aside from past injuries, a society might believe that less inequality is good for society as a whole and, thus, will object to Pareto efficient points that represent gross inequalities.

The Second Fundamental Theorem shows that such distributive concerns can be addressed by lump-sum redistributions of wealth. In other words, it is possible to separate the issues of economic efficiency and distributive equity. Society can, if it wants, achieve distributive goals through lump-sum redistributions, and let the natural workings of the market (Adam Smith's "Invisible Hand") result in a Pareto-efficient allocation where every individual's marginal utility equals society's marginal cost for all goods. This theorem does not claim that lump-sum redistributions strictly satisfy the Pareto criterion, because they do reduce someone's welfare, but it implies that, if remedying a past injury or reducing inequality is considered important to society's welfare, this can be achieved by a lump-sum redistribution. The Second Fundamental Theorem provides a theoretical basis for separating distributive goals from economic efficiency goals as much as possible in public policy.

The Second Fundamental Theorem requires the same assumptions about a competitive market as the First Fundamental Theorem, but it also requires stricter mathematical assumptions about preferences, particularly the convexity of indifference curves.^[1] Furthermore, the project of assigning lump-sum redistributions requires government to know everyone's utility function and to be able to administer personalized taxes and transfers across the whole population. However, government clearly lacks this knowledge and capacity. In theory, lump-sum taxes and transfers should not distort people's decisions at the margin. In reality, though, most redistribution programs are done through proportional and conditional taxes and transfers (i.e., taxes and transfers that depend on the ongoing economic choices of the individual, rather than representing lump-sum changes in the individual's starting position); these have the effect of changing the slopes of budget constraints and, thus, distorting economic behavior. So, the Second Fundamental Theorem is severely limited in applicability.

THE KALDOR-HICKS CRITERION

There are many situations where the competitive market assumptions do not hold; therefore, a

Pareto-efficient contract line cannot be reached through voluntary exchanges from any initial point. In such cases, the idea of compensation provides a useful decision rule. We have already seen that actual compensation can be included in the strict Pareto criterion, but what if the compensation is not made? If winners gain enough in welfare that they would be willing to pay the compensation and losers would be willing to accept the compensation, then the net welfare of society has been increased, even without actual compensation. It is often impossible or excessively costly to find all the winners and losers and arrange the correct compensations. A modification of the Pareto criterion, called the Kaldor-Hicks criterion after two twentieth-century British economists, says that a policy change that increases net welfare should still be made.

Is it justifiable to make someone worse off because someone else is made better off by a greater amount? The Kaldor-Hicks criterion seems to violate the idea of fairness. However, it must be understood in light of the Second Fundamental Theorem. In theory, all the wealth of society is subject to redistribution. Thus, it makes sense to increase the total wealth of society as much as possible and to deal with questions of fairness in the same way that we remedy past injustices: by lump-sum redistributions, if possible. A policy that satisfies the Kaldor-Hicks criterion is one that increases the net welfare of society. Concerns about who is advantaged or disadvantaged can be addressed, if necessary, through redistribution of that net welfare. The Kaldor-Hicks criterion leads to this fundamental rule of benefit-cost analysis and policy making: that policies should be chosen to produce the greatest possible net welfare of society, as measured by subtracting the losses of losers from the gains of winners.^[5,6]

We started with the claim that welfare cannot be compared between individuals and cannot be measured in units, but can only be ranked on an individual, ordinal scale. Yet, we ended with a decision rule that makes just such a comparison. The idea of compensation provides the needed tool for this purpose: gains and losses in individual utility can be measured in terms of the monetary compensation that winners are willing to pay and losers are willing to accept. Thus, the monetary values of such hypothetical compensations serve as a useful approximation of welfare changes at the margin, allowing comparisons between gains and losses of different individuals.

This concept of compensation is closely associated with consumer surplus, the extra utility obtained by a consumer who can buy the demanded quantity of a good all at one price; such a consumer might be *willing* to pay a different price for every unit, equivalent to that unit's marginal contribution to utility (see Refs.^[1,2] for the mathematics). If a good represents a small fraction of one's total expenditures (a condition

approximated by an assumption called “quasilinear demand”), the increase in consumer surplus resulting from a change turns out to be the same as the willingness to pay compensation for that change. In Fig. 4, the demand curve (shown as linear) represents the consumer's willingness to pay for each additional unit at the margin. The area under this curve is the total willingness to pay, or the monetary equivalent of utility. The rectangular area under price line P_0 is what must actually be paid to get the quantity Q_0 , which is demanded at that price. So the triangular area above P_0 is the difference between willingness to pay and actual expenditures at that price; this is consumer surplus. If the price goes down to P_1 , the quantity purchased increases to Q_1 , total utility increases, and consumer surplus increases by the trapezoidal area between the two price lines. This increase in surplus is the consumer's willingness to pay compensation for a policy that effectively reduces the price. So, the Kaldor-Hicks criterion, to select the policy that yields the greatest net benefit, can often be measured in terms of net gains in consumer surplus—a standard tool in benefit-cost analysis.

DIFFICULTIES AND EXTENSIONS

In the real world, of course, the competitive market assumptions of the First Fundamental Theorem often

Fig. 4 Consumer surplus. At price P_0 , the consumer chooses quantity Q_0 . Total utility is the area of trapezoid OQ_0E_0U . Total expenditure is the area of rectangle $OQ_0E_0P_0$. Consumer surplus is the area of triangle P_0E_0U . With a price decrease to P_1 , the increase in consumer surplus is the area of trapezoid $P_1E_1E_0P_0$.

do not hold, and government lacks the knowledge and administrative ability necessary to make the individualized lump-sum redistributions required by the Second Fundamental Theorem. One of the basic tasks of welfare economics is to identify when these assumptions are not met, to evaluate the resulting loss of welfare, and to analyze whether a specific government intervention would still be a Pareto improvement (or Kaldor-Hicks improvement) over the market outcome. Many economists view the two theorems as an argument against too much government intervention, and treat violations of the assumptions as exceptional cases to be addressed on a case-by-case basis. Other economists assert that the assumptions are so rarely satisfied that there exist many opportunities for government to create genuine Pareto improvements by intervention.^[7]

Some new perspectives on welfare economics are being provided by transaction cost and institutional economics. One is the insight that transaction costs result in market imperfections even more widespread than the traditionally recognized market failures. This argues against the assumptions of the two theorems and suggests a stronger role for government. However, there is the insight that economic, social, and cultural institutions may evolve so as to achieve efficiency by reducing transaction costs through means other than strictly competitive market exchanges. This suggests that even an imperfect market system has strengths unrecognized in the price equilibria of the standard model and may already be achieving efficiencies greater than those achievable through policy interventions.

There is also a new awareness of political economy. When social welfare values other than economic efficiency are to be pursued, the market process is insufficient and must be complemented with other public choice processes to reveal society's overall

preferences. However, when there are parties whose gains and losses might be altered by public policy, they have incentives to influence public decision making for their own advantage, so government intervention may result in neither Pareto improvements nor overall gains in social welfare.

In its standard model, and in these extensions, welfare economics provides arguments both for and against government interventions. It is still necessary for policy makers and analysts to consider how well each of these arguments applies to any particular decision situation.^[8]

Welfare Reform, Management of

Edward T. Jennings Jr.

Department of Political Science, University of Kentucky, Lexington, Kentucky, U.S.A.

INTRODUCTION

In the contemporary version of welfare reform, instead of processing claims for benefits, welfare organizations become agents for change, responsible for moving recipients and potential recipients into jobs and self-sufficiency. This requires a shift of organizational culture from one that views clients as victims needing support and help to one that views clients as responsible for their needs, requiring encouragement, motivation, opportunity, and services to accept that responsibility. All of this grows out of the dramatic change in welfare policy initiated in welfare-to-work experiments of the early 1980s, facilitated by the Family Support Act of 1988, and conclusively championed in the Personal Responsibility and Work Opportunity Reconciliation Act (PRWOR), or Personal Responsibility Act, of 1996.^[1]

To accomplish this transformation of welfare from an emphasis on entitlements to an emphasis on work and self-sufficiency, states had to accomplish several things. One was to develop a new set of policies. Those policies had to reflect choices between a variety of competing approaches.^[2] Beyond this, the states and their local implementing agencies had to undertake important management challenges: designing a client process; determining necessary services; identifying service providers and creating a service delivery network; locating, allocating, and using financial resources; mediating the intergovernmental system; managing contracts; designing and using information systems; changing the organization; and measuring results.^[3] In the end, from the perspective of many observers, the most critical task was to align public welfare organizations with policy goals.^[2,4-8]

CONTEXT AND SHAPE OF REFORM

The contemporary approach to welfare policy, one that emphasizes work and self-sufficiency, grew out of dissatisfaction with the system of public support for the poor that emerged from the Social Security Act of 1935, revisions to that legislation, and new initiatives to expand access, support, and services for the poor in the War on Poverty of the 1960s.^[9] Central to the debate over welfare reform was Aid to Families

with Dependent Children (AFDC), a federal-state program to provide cash assistance to families unable to support themselves. Focused originally on women with children, the program evolved over a 30-year period beginning in the 1960s to offer aid to some two-parent families.

There is insufficient space here to trace the economic, social, and political changes that created pressure for transformation of the American welfare system. We can simply note several important developments.^[1,3,10,11] One was the movement of women into the workforce in recent decades. Another was the growth of two-earner families. A third was a substantial increase in births to unwed mothers. A fourth was the shift of AFDC from a program serving widows and their children to one serving divorced, deserted, and never-married women and their children. Finally, there was the substantial growth of AFDC rolls in the late 1960s and the 1970s, followed by another spurt in the late 1980s and early 1990s. These developments changed perceptions of the welfare system and created widespread support for change.

It is important to recognize that public welfare, or support for the poor, encompasses a broad range of public programs and mechanism for meeting the needs of low-income families and individuals. Indeed, even though AFDC provided the lightning rod for political discontent with welfare, other forms of assistance—such as Medicaid, the Earned Income Tax Credit, and food stamps—provided a far greater share of support and grew rapidly in the 1980s, while spending for AFDC declined in constant dollars.^[1] Despite that range of programs and spending, the reform of welfare focused substantially on AFDC, and that reform is the subject of this entry on welfare reform.

A quick review of three phases of the American welfare system demonstrates the dramatic nature of the changes while permitting illustration of the central policy and management challenges of each phase. The first phase is the AFDC program, as it existed in the 1970s. The second phase is the period of experimentation with welfare-to-work programs by the states in the 1980s, first under waivers to AFDC policies and then under provisions of the Family Support Act of 1988 with its Job Opportunities and Basic Skills program. The third phase is one of time limits on benefits and mandatory work under the Personal Responsibility

Act of 1996 and its Temporary Aid for Needy Families (TANF) program.

Under AFDC in the 1970s, the primary concern was to provide cash assistance, food stamps, and Medicaid to those in need while avoiding eligibility errors. These were entitlements, and the primary thrust was to make sure that those with needs were served. The second phase in the 1980s represented a response to concerns about welfare dependency and the need to help the poor become self-sufficient. Both before and after the Family Support Act, a mix of experiments sought to move recipients from welfare to work through some combination of education and training, work requirements, and supportive services. The principal pathway to this was not better jobs and wages, but mandates to participate in work programs or lose benefits. Sanctions were limited during this phase, services were a central focus, and most states in practice stressed voluntary participants. States tended to follow a human capital approach, which emphasized developing the knowledge, skills, and abilities of welfare clients so they could better compete in the labor market.

The third phase, under the Personal Responsibility Act and TANF, represented a dramatic departure from the welfare of the 1970s. Federal law placed a 5-year limit on lifetime benefits, required engagement in work activities within 2 years after beginning receipt of benefits, allowed states to disallow benefits to a mother who has a child while receiving welfare benefits, and gave states much greater leeway on how they manage their programs. Under TANF, the emphasis was on a work-first approach that involved getting welfare clients as quickly as possible into work activities. Rather than developing skills through education and training, the immediate goal was a job. Training and education can come later, after the client accepts personal responsibility for the well-being of family and self and experiences the success of work.

Thus, the three phases represent very different approaches to the needs of the welfare population based on very different theories of the sources of their problems and the ways to solve those problems.

POLICY CHOICES IN REFORM

In the quest to reform welfare and put in place a new system, policy makers and managers designing a reformed system had to make choices between competing conceptions of public priorities and the best way to achieve the ends of reform.

As states experimented with different versions of welfare-to-work programs, there were two basic differences in design choices.^[3,10,12] One involved the question of whether client participation would be voluntary or mandatory. Proponents of voluntary participation

believed that welfare participants wanted jobs and would take advantage of opportunities if they were made available. Proponents of mandatory participation believed that many welfare recipients did not want to work and would not do so unless it was required. The other basic design difference involved the question of whether the path to success would be found through work experience or education. Proponents of a human capital development approach point to the low educational attainments of many welfare recipients as the principal barrier to self-sufficiency. They believe that welfare recipients need basic job skills, education, and training if they are to leave the rolls and achieve self-sufficiency. Proponents of a work-first approach believe that many welfare recipients have not succeeded in educational activities in the past and are better served by programs that get them into a job so they can enjoy success.

The Personal Responsibility Act requires mandatory participation of a substantial portion of the welfare population. Many states have been even more insistent on mandatory participation. While many states emphasized education and development of literacy and other basic skills in their Job Opportunities and Basic Skills programs, most shifted quickly to a work-first orientation as they implemented TANF. Thus, the move was clearly to tougher requirements, more work, and the development of skills on the job instead of in the classroom.

States made a series of policy choices as they implemented the Personal Responsibility Act. This included, first, a set of choices that shaped participation in TANF, decisions about time limits, work exemptions, asset and income limits, sanctions, participation requirements, and family caps. States varied in their choices on these matters. Those choices made it more or less difficult for individuals to receive cash incentives and provided greater or lesser degrees of incentives for individuals to leave or fail to enter the welfare rolls.^[8,13] Second, states made a set of choices about how to pursue the work-first agenda. Gais, Nathan, Lurie, and Kaplan identified six variations of the work-first model.^[2] These included two motivational strategies, an employment service strategy, two adaptive service strategies, and a compound system.

One motivational strategy has work participation as its primary goal. States following this strategy try to decrease the cost of employment and increase its gains. The purpose is to increase the financial rewards of work through high earnings disregards and high benefit levels that allow participants to continue to receive benefits while working. A second motivational strategy has reduction of dependency as its primary goal. This is achieved by minimizing dependence on cash benefits. Wisconsin, for example, pays families only for the hours they participate in work and offers extensive career and employment services. An employment

services strategy uses employment, training, and education services to build job-related skills and place participants in jobs. One adaptive services strategy has work as its primary goal. States following this strategy offer a diverse array of services and give workers and administrators considerable discretion to tailor the services to the needs of the individual client. They place little emphasis on caseload reduction. Other adaptive service strategies have reduction in dependence as their primary goal. They offer a wide array of services and programs but place more emphasis on caseload reduction than states that make work the primary goal. Finally, Gais and his colleagues suggested that some states are not so easily classified.^[2] These compound systems exist because the states devolved a range of policy and administrative decisions to counties and cities.

MANAGING REFORM

These strategic approaches and the demands of implementation more generally required states to design a client process; determine the necessary services; identify service providers and create a service delivery network; locate, allocate, and use financial resources; mediate the intergovernmental system; manage contracts; change organizations; design and use information systems; and measure results. This was a complex set of management activities that reflected a strategic set of choices made by the states.

Designing a Client Process

The client process under welfare reform is a set of steps by which clients are directed to work activities, assess their skills and work readiness, have their eligibility determined, and are provided services. The sequencing of these steps is guided by program philosophy, strategic considerations, and individual client characteristics. In many states following a work-first approach, potential welfare recipients are sent to look for jobs before any effort is made to determine their eligibility for welfare benefits. If that search is not successful or the state is one that does not so heavily emphasize work first, two alternative processes might be initiated. One is assessment to determine the job readiness, work experience, education, and skills of the client. That information is useful in designing a set of activities to move the individual into a work role. The other is determination of eligibility for welfare benefits. In addition to this, steps are taken to determine what supplementary service the client needs to prepare for work or support engagement in the workforce.

Related to the client process design is the question of who will guide the client through the system. The

typical response to that has been the case manager. Case managers have replaced the traditional social worker whose primary responsibility was to see that the client received benefits, if eligible. Case managers encourage and assist the clients' move to work, arrange supportive services, and link the different parts of the system.

Determining the Necessary Services

Welfare-to-work programs generally provide a diverse set of services for clients. These services help clients seek and obtain jobs, acquire knowledge and skills employers require, meet family obligations, and reduce barriers to work. Clients may need and be eligible for a variety of services to address barriers to work or support employment. Services to prepare clients to work can include job readiness training, basic education, general equivalency degree preparation, and vocational training. Barriers that might be addressed include health and mental issues, substance abuse, disabilities, family problems, lack of transportation, and family situations. Employment services help place clients in jobs. Common services to support work include child-care and transportation. Case managers have to assess the needs of individual clients to determine the need for these services. Assuming the need is present, they help arrange the service.

Identifying Service Providers and Creating a Service Delivery Network

In the contemporary social service arena, the full range of services is seldom integrated in a hierarchical organization. Instead, services are provided by a complex array of public, not-for-profit, and private organizations. Networks of these organizations create diverse opportunities for service delivery but also introduce significant coordination problems. While it is possible for the welfare agency to deliver all of the needed services, it generally is not practical, effective, or politically feasible to do so.

Over the years, states have evolved in different directions in selecting service providers. They differ in how extensively services are integrated in the welfare agency or dispersed to other organizations. In some states, responsibility for welfare-to-work was transferred to a new organization or placed in an agency with a stronger work focus. States may assign certain services to particular public agencies. They may contract out services to not-for-profit or private organizations. With such diversity in service delivery, contract management and monitoring can become critical dimensions of the management of welfare reform.

A critical management challenge here is to decide which services the agency can best handle itself and which it should outsource. This includes deciding which mix of private entities, not-for-profit organizations, and public agencies will serve program objectives in a cost-effective manner. Another critical challenge in this network setting is to insure that the network of service providers works effectively. Numerous studies document that this is a different and more challenging task than managing an integrated, hierarchical organization.^[14–16]

Locating, Allocating, and Using Financial Resources

Financial resources were not a source of concern for the managers of welfare reform during the first five years of TANF. Because federal support for welfare was put on a block grant basis not tied to the number of recipients and the rolls were declining throughout that period, states did not face significant financial constraints. In fact, some states did not spend all of the funds available. Thus, there was less pressure to search for ways to leverage resources of other agencies, like employment and training programs or school systems. As the economy weakened in late 2001 and the rolls started to increase again, there were hints that states would face financial pressures. These pressures were brought on in part by significant expansions in Medicaid spending and questions about whether federal funding would be reduced when the program was reauthorized.

Mediating the Intergovernmental System

In many ways, the Personal Responsibility Act reduced federal control and gave the states greater leeway to design and operate their welfare programs. This was not completely the case, because some mandates were put in place, such as those that would limit the amount of time that most recipients could receive benefits supported by federal funds. In addition, states that sought to integrate their welfare program with other federally supported services had to maneuver through the shoals of intergovernmental complications. More important for some states was the need to make decisions about decentralization within their own bounds. To what extent would local communities or counties be allowed to assume control of the program? Some states, like North Carolina, gave significant policy responsibility to local communities. Others, like Kentucky, let sub-state regions and local communities play a significant role in program management.

Managing Contracts

With welfare agencies relying on contracts to acquire the services needed to make reform work, there is increased need to monitor the performance of contracting organizations. Contracting is a well-established tool of contemporary public management, but its effectiveness depends on several factors. The agency has to clearly specify what the contractor will provide. There has to be competition for contracting to be effective. Standards are needed to gauge performance. Finally, the agency has to be able to monitor the contract. While a clearly written contract with specific performance standards aids monitoring, the agency must create effective processes to do the monitoring.

Changing the Organization

As states moved to reform their welfare systems in the 1980s and 1990s and implement the Personal Responsibility Act after 1996, the single biggest challenge they typically faced was to change the culture of the organizations responsible for welfare reform. This meant changing the attitudes, orientations, and behaviors of case managers and other service providers in the system. Studies by Meyers, Glazer, and MacDonald,^[4] Myers, Riccucci, and Lurie,^[5] Corbett,^[17] Hagen and Lurie,^[18] Ewalt,^[19] and others pointed to the critical problems. As Corbett^[15] put it, “Ultimately, the culture of welfare is defined by what clients experience when they interact with welfare agencies and with people who run those agencies.”

As many managers and policy makers have discovered, changing the culture is difficult. The various tools of change have to be deployed effectively. In welfare reform, managers have sought to produce change by clearly communicating the new priorities of welfare and the message of change, altering client processing and office arrangements to reflect the new priorities, redefining the roles of service providers, training staff, and modeling the culture change themselves.^[3] Symbols are an important part of the culture change. Labeling is one way to convey symbolic importance—Work First is a prime example.

Information System Design and Use

Information is the lifeblood of the design, management, and assessment of welfare reform.^[20,21] Good information systems provide case managers the information they need to work effectively with clients. Mandates like time limits mean states have to be able to track individuals to insure that they do not exceed the limits. Performance management means that states have to be able to generate data on performance and

use it. Effective information management allows states to do such things as making accurate payments to service providers on the basis of performance, make programmatic adjustments in response to fluctuations and trends in performance levels, and report performance information to the U.S. Administration for Children and Families.

Designers of information systems have to determine who needs information, when they need it, and in what form they need it. They have to determine who can best provide the information and how it can be entered in the system. This knowledge facilitates the selection of hardware and design of software.

Measuring Results

Policy makers, managers, clients, citizens, and interest groups believe that it is critical to measure the success of welfare reform. To judge the effectiveness of reform, we have to know the goals and objectives and be able to measure their attainment. Additionally, performance measures are central to much contracting. Despite this, and in spite of modern public management practices reflected in the Government Performance and Results Act,^[22] states and the national government have been slow to gather systematic data on performance.

Most studies of the impact of welfare reform and the Personal Responsibilities Act have focused on changes in the number of individuals and families receiving welfare benefits.^[8,23–25] The rolls, of course, declined dramatically in the years following TANF, although they had begun to decline before its adoption.^[3] States have also generated a set of one-shot studies of welfare-leavers (individuals and families who have left the welfare rolls), but they have not created systematic measures over time of what has happened to those who left welfare or those who did not enter the rolls. Those one-shot studies of leavers have examined the employment status, income, and well-being of former TANF recipients.^[26] Typically, 50 to 60% of welfare leavers are working at the time of state surveys. For the first quarter after exit, 50 to 68% of leavers report working. Thirty-nine to 62% were working in the fourth quarter after exit. Forty percent or more reported unemployment in one or more quarters during the first year after leaving the rolls. In the states that conducted studies, earnings were typically well below the poverty line.

The critical point to note is that welfare reform can have a variety of consequences.^[27] It can reduce welfare rolls and welfare costs. It can increase self-sufficiency. It can increase employment. It can increase or decrease poverty. It can leave families better or worse off, take children out of risk or put them at risk. It can affect teen pregnancy rates and out-of-wedlock

birth rates. While it can do all of these things, little effort is being made to gather systematic data with respect to these consequences. Performance is largely unmeasured.

CONCLUSION

Reform has dramatically changed the character, symbolism, and management of welfare programs in America. Policy makers and managers have struggled to craft policies and programs that alter the outcomes of the system. In pursuit of the new goals, welfare managers have had to change organizations, manage effectively in networks, develop useful information systems, create new approaches to client processing, craft a new role of case management, select appropriate services, navigate the intergovernmental system, and allocate resources effectively. While the changes have been dramatic, the bottom line remains unclear. We know that the rolls have declined, but we have little systematic information about the impact of reform on the well-being of the poor.

Welfare State

Paul B. Kirby

*University of Massachusetts Medical School, Center for Health Policy and Research,
University of Massachusetts, Worcester, Massachusetts, U.S.A.*

INTRODUCTION

At its most basic level, the term “welfare state” refers to a state’s use of its policy-making authority to guarantee some minimal level of material well-being to its citizens. Welfare states seek to attain this goal through various means, such as direct redistribution through progressive taxation, state-administered social insurance programs, regulation (of wage levels, working conditions, etc.) and state provision of services such as health care. Although the welfare state is generally understood to be a defining characteristic of Western democracies in the period after World War II, its origins actually date to the late nineteenth century. Further, aspects of the welfare state model have been adopted in non-Western countries.

This article discusses the welfare state phenomenon from three perspectives that are of particular interest to students of public policy and public administration. The first section discusses the normative rationales for the creation and expansion of the welfare state put forth by prominent political and scholarly supporters. Second, scholarly work seeking to provide causal explanations for the emergence of welfare states generally, and to account for the wide variety of specific modalities of the welfare state, is reviewed. Finally, the more recent turn to evaluation of the welfare state’s impact is discussed. That is, scholars have extensively analyzed the effects of welfare policies on a range of social and economic indicators, and their findings have had considerable influence over ongoing policy debates.

RATIONALES FOR THE WELFARE STATE

The Industrial Revolution entailed a dramatic dislocation of traditional social relations in Western countries. Social critics argued that industrial wage labor, fundamentally detached from any direct connection to the reproduction of daily existence, actually worsened the living conditions of the lower classes. Industrialization, in this view, removed the largely self-sufficient peasantry from its traditional agricultural pursuits, offering only repetitive, dehumanizing factory labor and utter dependence on cash wages in return. As a historical matter, this view is not entirely satisfactory. There is

ample evidence that rural workers began to participate in the cash economy well before widespread industrialization, through paid agricultural labor and small-scale production of intermediate goods, such as textiles, for sale (literal “cottage industries”).

Nonetheless, this critical view was broadly accurate and compelling. Generations of nineteenth- and twentieth-century social, political, and economic theorists struggled with the question of how to improve the lives of the workers. As the pace of industrialization accelerated in the later nineteenth century, concern over increasing social inequality and economic insecurity generated widespread agitation for reform. Prominent among the various rationales for reform were fears that loss of social cohesion would inevitably result from the impoverishment of workers; social critics wanted to create a harmony of interests among the various classes in society.

The nature of industrial production created new risks for workers, such as the increased potential for disabling accidents, and hardship due to unemployment and old age. Total reliance on wage earnings made such events catastrophic. The earliest welfare state policies, accordingly, were social insurance programs designed to insulate workers from these risks. Advocates insisted that the state would have to administer, and subsidize through general tax revenues, these programs, which private insurance markets would not provide. The state would also have to mandate universal participation in social insurance to guard against the problem of adverse selection.^[1]

In the 1930s, as the great depression demonstrated the inadequacy of the early social insurance programs in dealing with mass unemployment and destitution, supporters of the welfare state began to argue for a much more assertive program of expanded social insurance, state intervention in labor markets to bring about full employment, and direct redistribution through cash transfers where those measures prove insufficient. In the United States, President Roosevelt created a Committee on Economic Security, charged with creating policy proposals to send to Congress. In their 1935 report, the committee argued that, with wages falling in depression conditions, economic insecurity had begun to affect even full-time workers. In response, the committee called for “(a) program of economic security” having “as its primary aim the

assurance of an adequate income to each human being in childhood, youth, middle age, or old age—in sickness or in health.”^[2] Although the goals expressed in the committee’s report anticipated a much more extensive welfare system than that which the United States would later develop, the rhetoric of the report mirrored the widespread belief that economic stability would ultimately have to rest on vigorous government action.

As the welfare state continued to expand and become entrenched in the postwar period, arguments in support of it became more abstract. Marshall, for example, famously argued that the welfare state should be understood as the logical end of a three-stage historical process by which the concept of “citizenship” developed in the Western democracies.^[3] In his view, *civil rights*, or the idea of equality before the law, were generally established in the eighteenth century, laying the foundation for *political rights*, that is, the right of all citizens to exercise an equal share of political power through the vote, which prevailed in the West by the early twentieth century. With the civil and political spheres of citizenship established, the natural next step for citizenship was to extend to *social rights*.^[3] Marshall defined this broadly as “the whole range from the right to a modicum of economic welfare and security to the right to . . . live the life of a civilized being according to the standards prevailing in the society.”^[3]

ORIGINS AND DEVELOPMENT OF THE WELFARE STATE

In recent decades, scholars have turned their attention to the question of how the welfare state came to exist, both as a generic phenomenon and in its wide variety of manifestations. Early attempts at causal explanation of the welfare state phenomenon were marked by a tendency toward teleological “laws of development.” In this perspective, the welfare state is seen as the natural and necessary outcome of capitalist, industrial development.

The process of welfare state development, in this view, appears as a response of the early critiques of industrial capitalism made by welfare state proponents. As industrialization upset traditional societies, the resulting social problems led to the welfare state as a functional necessity (see, e.g., Refs.^[4,5]). At the same time, industrial development facilitated the emergence of the welfare state in two critical ways: 1) by giving rise to bureaucracy as the dominant organizational form, in politics as well as economics; and 2) by generating enough surplus wealth that redistribution and capital accumulation would no longer be seen as mutually exclusive (see Ref.^[6] for a discussion and critique of this theory). Variation between existing

welfare states is attributed primarily to the “economic level and its demographic and bureaucratic correlates” present in different countries, where these “correlates” are an aging population and an increasingly entrenched, self-perpetuating welfare bureaucracy.^[7]

Although the industrialization theory is an intuitively satisfying explanation for the existence of the welfare state in general, it fails to account for the significant variation in actual welfare states. A second broad strain of thought attempts to overcome this weakness by focusing on the political and electoral strength of the working class, and labor-based political parties, in explaining differences in the size, scope, and character of welfare states. Korpi, for example, analyzed the electoral power of the working class (as exercised through labor-based parties) along two dimensions: 1) mobilization, as measured by the percentage of the labor force that is unionized and the percentage of the electorate voting for labor-based, left-wing parties; and 2) control over government, as measured by representation of these parties in cabinets and parliaments.^[8] He found that countries in which the working class is highly mobilized and labor-based parties have governed for long periods of time, welfare states are at their most extensive and inequality is most dramatically reduced, as in Sweden and Norway.^[8]

Other scholars in this tradition have emphasized the ability of labor-based parties to form alliances with other classes, in particular, with farmers. Esping-Andersen, for example, argued that Social Democratic forces in the Scandinavian countries overcame opposition to their welfare state policies by creating broad coalitions with farmers, gaining their support in exchange for agricultural price subsidies, and other policies addressing their needs.^[9]

The discussion of the working-class strength thesis is at its strongest when explaining the emergence of large, comprehensive, and solidly institutionalized welfare states in the Scandinavian countries. Similarly, the industrialization theory presents a reasonably compelling explanation for the greater prevalence of welfare states among the rich, highly developed countries. But neither perspective can adequately account for the most significant outlier in crossnational comparisons of the welfare state—the United States. As many analysts have noted, the U.S. welfare state has lower benefit levels, is less extensive in its coverage, and intervenes less in the market economy than its European counterparts. Despite its great wealth, rapid industrialization, and abundance of eloquent social reform advocates, the United States did not develop anything comparable to the broad package of social insurance programs developed in Britain during the early twentieth century, much less the combination of universal, nonmeans-tested social benefits and Keynesian commitment to full employment that emerged in Sweden

during the 1930s and 1940s. This “American exceptionalism” has inspired a great deal of analysis in recent decades, leading to a school of thought that emphasizes the role of state institutional structures in shaping welfare policy regimes.

Most closely associated with Skocpol and colleagues (see, e.g., Refs.^[10–13]), this institutionalist theory charges both the industrialization and the working-class strength theories with being overly deterministic. Instead of seeing the welfare state as the natural outgrowth of social forces, this perspective sees state structures determining the range of policy responses to social and economic problems that a particular state might select. For example, both Britain and the United States confronted the (supposedly) objective “need” for social insurance programs to protect industrial workers from the insecurities of old age, sickness and disability, and unemployment. Yet, Britain developed a comprehensive array of such programs during the Liberal reform period of the early twentieth century, while the United States did not develop truly national social insurance of any kind until well into the Great Depression, and then only after considerable hesitation.

The institutionalists find the explanation for this discrepancy in the unique character of American political institutions, as compared with those found in Western Europe. The fundamental cause, in this view, is the weak administrative capacity of the national government in the United States, as compared with many European countries. One obvious cause of this weakness is the federal structure of the U.S. government, which for most of the nation’s history limited the power of national government institutions.^[14] Until the 1930s, state and local governments combined were larger than the federal government, both in terms of spending and in terms of exercise of regulatory power. The executive branch of the national government remained relatively weak until it was strengthened by the twin challenges of the Great Depression and World War II. Meanwhile, the U.S. Congress, influenced heavily by local concerns, had neither the ability nor the incentive to formulate any sort of national social welfare policy.^[10]

The deeper causes for the missing American welfare state posited by the institutionalist view are more complex, however. Somewhat ironically, the early extension of the right to vote to the white male working class set in motion a process of what these theorists call *state formation* that would later hinder the development of a welfare state. Although the question of male working-class suffrage caused bitter political struggles in most of Western Europe, white male American workers obtained the vote by the middle of the nineteenth century, with relatively little controversy. Because the expansion of suffrage preceded the

bureaucratization of state institutions, American political parties competed for votes on the basis of patronage, or the exchange of government offices and resources for votes. In the European countries, by contrast, universal male suffrage came much later, with economic restrictions on the franchise in place until the early twentieth century. This late democratization came after European state institutions had become firmly bureaucratic, with access to government jobs and funds strictly controlled by a professionalized, non-political civil administration. Thus, political parties had to compete for the votes of newly enfranchised workingmen on the basis of policy programs, rather than patronage.^[11]

Whether a country’s political parties were programmatic or patronage based had a critical impact on the formation of welfare states. The legacy of patronage is most clearly seen in the proliferation of government pensions for veterans of the Union Army (and their survivors) in the American Civil War. Eligibility for these pensions, which initially were limited to demonstrably disabled veterans, was gradually liberalized to the point that any veteran of age 62 years or older could receive benefits.^[12] But instead of signaling the emergence of an American protowelfare state, the Civil War pensions became a means for the Republican Party to secure its electoral dominance in the postwar period. By assisting constituents with their pension applications, and by fervently advocating liberalization of eligibility rules, Republican members of Congress bolstered their re-election prospects. Because Confederate veterans were not eligible, southern Democratic politicians could not take similar advantage of the patronage opportunities the pensions offered.^[12]

As a result, early twentieth-century social reformers in the United States, who were closely associated with the largely middle- and upper-class Progressive movement, were more concerned with combating the corruption endemic in patronage electoral democracy than with expanding the power of the national government to address the social dysfunctions of an emerging industrial capitalist economy. Progressives, consequently, opposed the extension of the Civil War pensions into a true national system of old-age pensions, preferring instead to press for various social insurance programs at the state level, to be financed through payroll contributions from workers rather than through general government revenues. The lack of support by Progressive reformers for non-contributory old-age pensions soured the relationship between Progressives and the labor movement, headed by the increasingly powerful American Federation of Labor (AFL) umbrella group. The AFL refused to support the Progressives’ call for mandatory, contribution-based social insurance programs; in the absence of broad, crossclass support, few such programs were

established.^[12] In contrast, British reformers, centered in the governing Liberal Party, enacted a non-contributory pension system in 1908, which helped them to maintain their cooperative relationship with the emergent Labour Party and its union supporters. This cooperation was essential to the enactment of contributory unemployment and health insurance programs under the National Insurance Act of 1911.^[13]

Only when faced with the severe crisis of the Great Depression was the United States able to create national social insurance programs covering old age, unemployment, and (later) disability. Compared with their European counterparts, America's social insurance programs have remained limited in terms of coverage and benefit levels, particularly in the areas of health care and disability. In contrast to most of Western Europe, the United States has only developed meager programs of direct social assistance to working-age adults. Such programs are generally available only to single mothers and offer very low benefit levels. Other hallmarks of European (in particular, Scandinavian) welfare states, such as active intervention in labor markets to ensure full employment, have received little, if any, serious consideration in the American political system. The institutionalist perspective is useful in understanding this lack of welfare state development in the United States.

The theories discussed above apply, of course, mainly to the economically advanced Western democracies. In recent years, a number of scholars have turned their attention to welfare states in non-Western, particularly East Asian, countries. Although the modes of operation of non-Western welfare states do not fit the Western model, many East Asian countries have, in functional terms, what may be considered welfare states. For example, Japan and South Korea have extensive social insurance programs, covering health care, disability, and pensions. However, these programs involve more regulation than direct expenditure by the state, which tends to act as a coordinator of insurance plans run by private companies, mutual-aid societies, and local authorities. Consequently, by standard measures such as government expenditure levels, these programs may not be recognized by Western commentators as constituting a welfare state.^[15] Other analysts have viewed welfare policies as an adjunct to Asian states' overall policies of state-guided economic development (see Ref.^[16] for the application of this view to Japan). Finally, some authors argue that East Asian countries have in fact followed a pattern of welfare state development that is broadly similar to the European model.^[17] As East Asian countries continue to develop economically, and as capitalism emerges in formerly Communist Central and Eastern Europe, the study of newly developing welfare states will undoubtedly expand.

EVALUATING THE WELFARE STATE

Although the question of the historical origins of the welfare state and its variations has primarily been of interest to academic social scientists, the issue of the welfare state's effects on economies and individuals has attracted a broader audience. Studies of welfare state effects have looked at two sets of variables. Some have concentrated on strictly economic variables, both microeconomic (e.g., individual labor market behavior) and macroeconomic (e.g., fiscal limitations on the welfare state and affects on the competitiveness of national economies). Others have assessed the influence of the welfare state on personal behaviors, such as decisions to marry and give birth. This division is not a strict one, however, as some studies have drawn connections between family formation and labor market behavior.

Concerned with the dramatic slowing of economic growth in the Western industrialized countries that began in the 1970s, economists have become highly critical of the welfare state's impact on growth, international competitiveness, and employment. These concerns are especially sharp in the Western European context, in which more extensive welfare states and more pronounced economic slowdowns have been combined. Many commentators, both academic economists and business journalists, have argued that economic growth in Western Europe has lagged behind that of the United States since the 1970s, largely due to the impact of the welfare state. The critical point in this critique is that the welfare state, by protecting workers from the negative consequences of economic change, hinders the process of economic adjustment to new conditions. Generous unemployment benefit programs, labor market protections in the form of legal restrictions on the ability of companies to fire workers, and other features of European welfare states have, in this view, slowed the European transition from economies heavily reliant on manufacturing to a more service-based model.

Indeed, the term "sclerosis" has often been used to describe the difficulty of Western European economies to adjust to new international conditions, resulting in persistently high rates of unemployment. This "sclerosis" has several components. Labor costs, particularly in the manufacturing sector, are among the highest in the world, due to the cost of mandated employer contributions to social insurance programs and the role of collective bargaining in setting wages. High labor costs, in combination with employment protection, began to cause dramatically slower growth in manufacturing sector employment, leading to high levels of joblessness, especially among the young. Meanwhile, the welfare state reduced incentives for economic actors—firms as well as workers—to adjust

to changing economic conditions. High wages, resulting from social insurance costs and legal regulation of minimum wages, prevented economies from shifting toward lower-productivity, lower-pay service industries, while essentially unlimited benefits reduced the incentive for the unemployed to seek jobs outside manufacturing.^[18,19] A deeper concern is that the persistence of this situation will alter long-term social norms about the importance of work and avoidance of relying on welfare benefits.^[20] Such changes in social norms threaten both the economic growth and the long-term viability of the welfare state itself.

Although the above discussion applies most obviously to Western Europe, the debate over public old-age pensions has assumed great importance on both sides of the Atlantic. There is little mainstream controversy surrounding the basic desirability of pensions, yet there is great concern over funding them. The funding problem stems from the fact that most public old-age pensions operate on a “pay-as-you-go” basis, in which the payroll taxes of active workers pay for retirees’ pensions. At present, the value of payroll taxes collected from workers is sufficient to fund current pension obligations in most industrialized countries; in the United States, much more tax is collected than presently needed, leading to a large surplus in the social security system. However, demographic trends common to all industrialized countries threaten this stable situation. Because birthrates in the wealthy countries have fallen so sharply, the ratio of workers to pensioners is projected to decrease dramatically during the first-half of the twenty-first century. Pension obligations could lead to a fiscal crisis across the industrialized world.

The economic projections involved are highly sensitive to changes in baseline assumptions (particularly in economic growth rates); however, the pension issue has attracted much public attention. Proposals in the United States to reform the social security system (which is actually in a much better fiscal position than public pension programs in most of Europe and in Japan) generally advocate the diversion of some portion of current payroll taxes to higher-return investments in equities, rather than, as at present, government bonds.^[21] Advocates of this change argue that it will increase the pool of available funds for future retirees; most proposed plans would also raise the minimum age at which retirees can begin receiving benefits. Proposed reforms of European public pension plans are similar to those in the United States. Although preliminary reforms have begun to narrow the projected gaps in future pension funding in a number of European countries, further changes will be needed to meet the needs of rapidly aging societies.^[22]

Finally, a great many critics, particularly in the United States, have argued that the welfare state has

severe negative effects on the behavior of recipients, in the critical areas of work and family formation. The focus of these critics is on public assistance programs for working-age adults, primarily single mothers (these programs, and not others such as social security, comprise what is generally thought of as “welfare” by the American public). Murray maintained that the expansion of welfare benefits during the 1960s actually worsened the lives of those it was intended to help—the poor and, especially, racial minorities.^[23] He asserted that programs such as Aid to Families with Dependent Children (AFDC) created perverse incentives for recipients, encouraging women to have children outside of marriage. More broadly, Murray argued that the expansion of public assistance reduced the stigma attached to receiving benefits instead of working, causing the poor to view welfare as a legitimate alternative to low-wage work.

Although Murray’s conclusions have been hotly contested (see, for example, Ref.^[24]), they have had great impact, both among other critics and among policy makers. The idea that public assistance programs have created a “culture of dependency” among recipients has become commonplace, leading many to call for welfare policies to reverse this trend. Mead, for example, argued that welfare policy in the United States should put less emphasis on the right to benefits as an entitlement, and instead focus more on responsibilities of recipients.^[25] In particular, he called for public assistance programs to force recipients to participate in training, job search, and “workfare” activities. More recently, Mead advocated a “new paternalism” in welfare policy, in which public assistance recipients’ progress toward employment goals is closely monitored by caseworkers.^[26] The criticisms of Murray, Mead, and other authors strongly influenced the 1996 Welfare Reform legislation, which ended the federal entitlement to AFDC benefits, replacing this with Temporary Assistance for Needy Families, a time-limited program explicitly designed to move recipients into jobs as quickly as possible.

The critiques discussed above have had obvious effects in the political arena, in both the United States and in the Western Europe. Although there have been differences in emphasis—for example, American critics of the welfare state have focused on the behavior of recipients, whereas Europeans have been more concerned about overall economic outcomes—the end result on both sides of the Atlantic has been a reconsideration of the scope, and even the desirability, of many aspects of the welfare state. The welfare state, which in the early postwar years commanded a broad favorable consensus across the industrialized world, is now the object of serious political contention.

INTRODUCTION

The phenomenon of whistle-blowing may stir up images of the uncovering of unethical practices in various businesses, but in a loose sense, it has occurred since the mid-1800s within corporate organizational structures. Generally, it is someone telling the truth about wrong actions taken by an entity to some agency, which can bring to bear some type of ramifications on the entity at hand. To better understand what whistle-blowing is, we consider the salient features of a few contemporary definitions, the context in which it occurs, and the ethical tensions involved. We then turn to important public policy questions related to whistle-blowing.

SALIENT DEFINITIONS

Jubb^[1] offers an analysis of contemporary definitions and one's definition of whistle-blowing. Jubb's definition is: "Whistle-blowing is a deliberate non-obligatory act of disclosure, which gets onto public record and is made by a person who has or had privileged access to data or information of an organization, about non-trivial illegality or other wrongdoing whether actual, suspected, or anticipated, which implicates and is under the control of that organization, to an external entity having potential to rectify the wrongdoing."

Jubb's definition flows from the understanding that whistle-blowing at the core presents ethical dilemmas for the agent involved in the action. First, a dilemma emerges for the agent with respect to the organization's wrongdoing in light of an organization's established values and/or the agent's personal values. If the organization decides to assent to the wrongdoing over its established values, the dilemma will pit the organization as a whole against the personal values of the agent. This is viewed as an explicit form of dissent within the organizational structure. For Jubb, the central dilemma that an agent faces hinges on one's loyalties to the organization versus loyalties to oneself and/or other entities. This dilemma is set in a context

of loyalty that is often implicit within the structure of an organization that hires a person to become an employee with access to the confidentiality surrounding ideas, information, and products. Thus the agent must pit one's loyalties to an organization that has provided employment against loyalties to oneself, colleagues, the profession, family, or the general public.

The last crucial element that must be underscored in Jubb's definition is that the wrongdoing must be disclosed to an external entity; otherwise, no ethical dilemma will arise for the agent. If the agent is not put in a position to choose to override the loyalty created by being able to access confidential materials as an employee, then the dilemma fails to materialize; thus the conditions seen as sufficient for the definition also are lacking. The formulation of a loyalty dilemma is a vital component for Jubb's definition and is the salient feature that requires emphasis.

Our second definition is expressed by Davis^[2] and shifts the central feature away from loyalty dilemmas toward understanding an agent's complicity in organizational activities that may involve wrongdoing. Davis' definition, which he calls a theory, is as follows: "You are morally required to reveal what you know to the public (or to a suitable agent or representative of it) when:

- (C1) What you will reveal derives from your work for an organization
- (C2) You are a voluntary member of that organization
- (C3) You believe that the organization, although legitimate, is engaged in a serious moral wrong
- (C4) You believe that your work for that organization will contribute (more or less directly) to the wrong if (but not only if) you do not publicly reveal what you know
- (C5) You are justified in beliefs (C3) and (C4)
- (C6) Beliefs C3 and C4 are true."

Davis sees his definition of whistle-blowing as differing primarily and most importantly in (C4). Here,

Davis expresses what he means by complicity. Complicity is important because it is the feature that ties the agent's work with the internal actions of the organization. An agent in an organization will remain an accomplice if he/she overlooks and remains with the organization and even if he/she quits. Whistle-blowing occurs when the agent is put in a position in which taking this revelatory action is the means to break these ties. The action of going public with the wrongdoing prevents complicity on the agent's part. Davis recognizes the issue of loyalty, but he sees complicity as a key feature encountered in many and various whistle-blowing cases, whereas on the other hand, Jubb also recognizes complicity but places emphasis on the need for an ethical dilemma to be formed for whistle-blowing to occur. These are two novel definitions of whistle-blowing that attempt to point out salient features of whistle-blowing. This is not an exhaustive list, but does hone in on important aspects of whistle-blowing that help us understand what it is.

TENSIONS FACING THE WHISTLE-BLOWER

Without reflection, it may seem like the whistle-blower sees the wrongdoings within one's organization and does what is right, but the tensions faced by the whistle-blower are often more substantive than just seeing the wrong and then doing the right thing. Any time issues that involve loyalty and means to a livelihood are at stake, moral and practical tensions will likely follow.

The seemingly most obvious aspects of whistle-blowing involve the moral criteria being brought to bear on the wrongdoing and the practical ramifications that might occur from the "disloyal" action. Nonetheless, Jensen^[3] highlights five substantive issues that reveal the deeper moral tensions. Generally, these moral tensions are as follows:

- Moral obligations to organization and colleagues
- Ethical standards of, and obligations to, a profession
- Adverse effects of the action on family or primary groups
- Moral obligations toward oneself
- Ethical obligations toward the general public
- Effects on bedrock values.

When considering moral tensions, it is obvious that some very practical matters seem to fall out, such as the possibility of financial hardships that could occur for the employer and employee. Further thought on these moral tensions can reveal more practical tensions. First, if loyalty is established between the employer and the employee at hiring, then that loyalty is placed under stress when whistle-blowing occurs. This can result in the suspension of the benefits the

company provides the employee and vice versa. So not only are the whistle-blower's personal interests affected, but many times the agent also considers the various ramifications that can result for an organization. Those damages can be significant—ranging from disruption of normal business functions, to loss of profits, to damaged internal and external credibility, to moral tensions that emerge for the agent's colleagues in that they can be adversely affected by the act. Of course, this may be superseded by the idea that long-term benefits will result, but it is not guaranteed. Second, a tension will exist between the need for an organization to make a profit and the credibility that certain professions may need when looked on by the public, such as medicine or law. Third, there will be potential for tensions from within and without the family of the agent, with the potential for increased publicity, financial hardship, loss of friends, and cruelty toward family members, which need to be weighed. Fourth, the agent should consider the personal risk taken in such actions, which may result in loss of a job, respect, confidence from others, and in oneself, as well as difficulties in future employment. Fifth, public reaction could be mixed regarding the revelation of the wrongdoing. The agent should consider the short-term and long-term ramifications of the act on the public. Lastly, Jensen considers that some deeply held values might encounter friction. For example, the difficult choice and potential consequences of telling the truth in a whistle-blowing scenario may be chosen over the friendship of a peer within the organization. Again, the issue of loyalty is a centerpiece for the culmination of moral tensions, and the practical ramifications of being implicated in wrongdoings within the company drive many of the practical tensions that accompany whistle-blowing.

PUBLIC POLICY AND WHISTLE-BLOWING

The ultimate goal with respect to public policy and whistle-blowing should be to eliminate as much as possible the need for engaging in it, by reducing its legitimate causes.^[4,5] Given the moral and legal failures of business scandals (e.g., Enron and MCI Worldcom), we must do all that we can, both institutionally and legally, to encourage the practice when it is justifiable or obligatory. Having good institutional procedures and policies in place, which reduce the need to go public or to the court, is highly desirable. Until then, laws (or regulations) could be formulated so that the potential whistle-blower is required by law (or regulations) to do so, which could remove some of the burden from the individual, as could anonymous hotlines, ombudsmen, and government inspectors general. For example, the Toxic Substances Control Act of 1977 requires

companies that produce chemicals to direct their employees to report chemicals that constitute a substantial risk to people's health or to the environment.

When is whistle-blowing morally justifiable and, hence, legitimate? DeGeorge^[6] has addressed this issue, and offers three conditions that must be met for whistle-blowing to be morally justifiable. First, the issue must involve a serious harm to the public or to particular segments of the public. For example, if an employee becomes aware of one's company manufacturing and selling unsafe tires as those of high quality, there is an obvious risk to the public. Second, an employee must first report the concern to one's immediate superior. An advantage of this condition is that, if the issue can be handled internally, this preserves loyalty to the company as well as the protection of the public interest. Third, if an employee sees that nothing is done to address the problem, he/she can take her concern up the ladder as far as necessary. If no satisfactory response ensues, then the employee can go public with the concern, whether it be to the media, the government, or some other group that can apply pressure on the company.

Of course, whistle-blowers have been subject to penalties, demotions, isolation in the company, blackballing in the industry, and discharge from their jobs. With this in mind, consider the other points regarding whistle-blowing raised by DeGeorge. It is arguably easier to change laws than it is to change the practices of all corporations, and so issues related to whistle-blowing must be addressed by the law. For example, it should be illegal for a company to fire or take other punitive actions against a whistle-blower, at any time, if the employee has satisfied the set of conditions discussed above. Additionally, the law could include penalties for those individuals within a corporation who are responsible for the defect or harm, instead of just fining the company and leaving the people who are actually morally responsible untouched. Another suggestion is that all companies of a certain size or larger could have (mandated by law) an inspector general whose job is to look for immoral and illegal practices, and be a resource for employees to go to to voice their concerns. Unfortunately, prohibiting the punitive treatment of whistle-blowers by corporations cannot be entirely accomplished by the law, given the subtle ways a company can punish a whistle-blower. However, some of the immoral treatments of whistle-blowers can be stopped by the practices discussed above. Another strategy for encouraging and protecting whistle-blowers is for unions and professional organizations to provide channels for whistle-blowing, as well as protection of those who call attention to an immoral or illegal corporate practice. Generally, professional organizations and societies have failed to protect their members. The problem is that such

organizations may not have sufficient resources, or sufficient power, to do anything, which again stresses the need for legal sanctions and motivations for ethical corporate behavior and protection of whistle-blowers.

The need for laws and regulations to promote ethical behavior in business is exacerbated by the complexity and new forms of business conduct.^[7] These complexity and newness may make an appeal to traditional ethical precepts less effective than in the past. In 1991, the United States Corporate Sentencing Guidelines went into effect, enjoining both uniform and severe penalties for corporations found guilty of criminal misconduct. In the guidelines, corporations are given incentives for the adoption of ethics programs. If they have such programs, the penalties are significantly reduced if and when a corporation is convicted of an offense but have a program in place prior to that offense. Additionally, it is often the case that both federal and state prosecutors consider refraining from prosecuting a company for misconduct if an ethics program was in place prior to the offense.

The Corporate Sentencing Guidelines offer seven steps to help guide the formation of an ethics program that will both meet government approval and be an effective deterrent of wrongdoing. First, a company's ethics standards and procedures must be specifically constructed so as fit to the company's particular business and needs. Second, particular individuals who are high-ranking officials in the company must be personally involved and responsible for compliance, legitimizing the company's stated ethical goals. Third, companies are to avoid delegating significant discretionary authority to individuals who have shown themselves to be inclined to illegal conduct. Fourth, company leaders should seek to communicate in an effective manner ethics policies and procedures to employees and other agents of the company. Fifth, companies should work for compliance with the standards through monitoring, audits, and a working reporting system. It is important that companies target likely offenses in their monitoring, and they also should have a functioning disciplinary process in place when misconduct is discovered. Establishing a culture of morality and compliance with the law can do much to discourage immoral and illegal behavior. Sixth, companies must have disciplinary procedures in place for enforcing the ethics program. This might include reprimands, fines, suspension, or firing. Lastly, companies must respond to offenses and seek to deter further ones. When misconduct does occur, it should be reported to the government. In addition, companies should modify their ethics programs and other policies, procedures, and structures, as needed, to avoid future problems.

Governmental agencies such as the Environmental Protection Agency, the Nuclear Regulatory Commission

(NRC), and the Department of Health and Human Services can be instructive when seeking to develop effective ethics programs. For instance, with respect to whistle-blowing, the NRC gives more specific and detailed guidelines than the Corporate Sentencing Guidelines to the nuclear industry, partly because of the significant harm that could be avoided by whistle-blowers coming forward. NRC policy includes the training of supervisors to understand the value of whistle-blowers to the corporation, and it pushes the importance of having incentive programs in place that will encourage whistle-blowers to report dangerous, immoral, or illegal practices.

How Effective Are Whistle-Blowing Laws?

The level of corporate change regarding whistle-blowing policies in response to legal changes has been analyzed.^[8] According to the research of Near and Dworkin, protective legislation at the state level has not been effective. When whistle-blowers suffer retaliation, the majority continues to employ wrongful firing tort suits instead of seeking legislative protection via state statutes. Near and Dworkin explore whether the whistle-blowing statutes enacted by many states caused firms within those states to establish internal mechanisms for reporting wrongdoing as a possible explanation of the fact that no increase in the number of whistle-blowers seeking legislative protection has occurred.

Near and Dworkin surveyed a representative sample of *Fortune 1000* firms with headquarters in states where legislative protection of whistle-blowers exists. From the data they compiled, they conclude that the majority of firms continued to do business as usual, such that the passage of the whistle-blower statutes had little effect on corporate whistle-blowing policies and mechanisms. Most companies that responded heavily relied on an open-door policy, which Near and Dworkin argue is equivalent to no policy at all because employees feel that such policies are neither effective nor protective. Moreover, the policies of the majority of companies responding to the survey do not meet the Corporate Sentencing Guidelines because an open-door policy is not sufficiently specific, lacks the involvement of high-level officials, and does not include protection from retaliation against whistle-blowers. Companies surveyed failed to meet the guidelines with respect to the dissemination of information regarding their ethics statements and open-door policies. Because of this, then, they would be susceptible to harsher

sentences and fines, unless they instituted new policies in line with the guidelines. Lastly, the research of Near and Dworkin shows that whistle-blowing statutes enacted by many states did not cause firms within those states to establish internal mechanisms for reporting wrongdoings, given that only a fifth of the firms responding to their survey indicated that they had established such mechanisms in response to the changes in state statutes. To remedy this situation, Near and Dworkin suggest that: 1) legislation, which effectively encourages employees who become aware of wrong doing to blow the whistle, must be enacted and 2) governmental incentives, which encourage firms to construct internal channels for whistle-blowers to employ, must be put into place.

CONCLUSION

Whistle-blowers who are justified in bringing wrongdoings to light arguably deserve protection from the backlash that often occurs. Although legislative changes are important, it appears that more must be done to encourage change within corporate structures such that whistle-blowing, when justified, is not only allowed but encouraged. Public confidence in corporations as well as the public interest require nothing less.

Win-Win Approaches to Domestic Peace, Prosperity, and Democracy

Stuart S. Nagel

Political Science Department, University of Illinois, Urbana, Illinois, U.S.A.

INTRODUCTION

Win-win domestic policy analysis involves applying win-win analysis to domestic problems that relate to peace, prosperity, and democracy. Win-win analysis refers to analyzing a policy problem in such a way as to determine what alternative might be proposed that would enable conservatives, liberals, and other major viewpoints to come out ahead of their best initial expectations simultaneously.

In this article, win-win analysis is applied to domestic peace issues that relate to internal violence stemming from drug addicts seeking money to pay for drugs or seeking to expand territory for selling drugs. The analysis is applied to prosperity issues that relate to simultaneously dealing with inflation and unemployment. The analysis is also applied to democracy issues that relate to increasing voter turnout.

All of these applications view peace, prosperity, and democracy in a domestic or national context rather than in an international or multinational context, as is done in a related article in the Summer 2001 issue of *Peace, Prosperity, and Democracy*. There, the peace problem is the problem of U.S. foreign policy since the Cold War and the relation between the United States and United Nations. The analysis is applied. The prosperity problem relates to tariffs and international exchange rates. The democracy problem is promoting international democracy through trade and other means.

PEACE ANALYSIS: DRUG VIOLENCE

Conservative and Liberal Positions

The last policy problem regards drug-related crime, which has become an increasingly serious issue. It currently consumes a great deal of money in the United States, and is causing enormous losses in productivity. It is causing governments to engage in corruption and police officers to use abusive behavior due to the tremendous frustration brought on by the drug war (Table 1).

The key conservative goal in this context is to eliminate or greatly reduce drug-dealing. This means reducing the buying and selling of illegal drugs, most

commonly heroin, cocaine, and marijuana. Cocaine and crack represent the largest problem, with involvement in a large percentage of crime that occurs. Sixty to seventy percent of all people who are arrested for crimes against property or crimes against person are arrested under circumstances that indicate that they are stealing in order to get money for drugs. Often, they are under the influence of drugs while committing crimes. The crimes against the persons usually involve power plays for staking out drug territory. They frequently lead to murder, because under the influence of drugs, people behave in a more aggressive way than they otherwise would.

Liberals are especially concerned about reducing the side effects of the war on drugs. These side effects refer to the police engaging in more illegal arrests, illegal searches, and illegal interrogations than before crack cocaine became widespread in the mid-1980s. They also include the tremendous amount of money necessary for the imprisonment of over 1,000,000 people in our prisons and 500,000 people in our jails. That money could be much better spent on health care, education, or other more useful purposes.

The conservative solution has been to try to repress the sale and possession of drugs. This law enforcement type of approach is an approach of repression, of prohibition. One of the more extreme liberal approaches, although becoming somewhat more popular, is legalization. The policy of drug prohibition and repression is analogous to the policy of liquor prohibition. Back then, the United States policy makers realized that liquor prohibition did not work, and that the policy's abolishment was better, even if it meant more alcohol-related crime. Legalization is the liberal alternative to conservative police enforcement and repression.

A Win-Win Alternative

The object of the win-win solution is to come up with some kind of idea that wipes out the drug dealers but will not increase the use of drugs. Another way to phrase it is to de-profitize drug dealing. If you de-profitize drug dealing, then you also eliminate the side effects. The organized crime cartels would fall without drug money to support them, and crime would

^d++ = The best of the alternatives on the goal after the superoptimum solution alternative is considered.

decrease accordingly. Another side effect that would be eliminated is the corruption of government officials due to the availability of “mutually profitable arrangements” with large dealers. An ounce of pure cocaine has a street value higher than that of an ounce of gold. This causes a lot of frustration for the police, because as soon as one drug dealer gets arrested and imprisoned or killed, there is another set up to immediately take their place. The money is just too good for some people to turn down.

The way to de-profitize drug dealing is to treat drug addicts like sick people and to consider them criminals only if they engage in crimes other than possession and use of drugs. But, a key part of the treatment is to treat drug addicts as being in need of medical treatment under our current health care programs. As health care plans move in the direction of becoming universal, the need to cover drug addiction is important. If drug addicts are considered to be sick people and eligible for prescription drugs, that could include a cocaine substitute or even actual cocaine under a cocaine maintenance program. The profits of drug dealing would be wiped out, because addicts would be able to get what they need through their subsidized health maintenance organization (HMO). These maintenance prescriptions would usually be given on a long-term, phase-out basis until the person is clean. If they never kick their drug

habit, their doctors can prescribe additional doses. No more would drug dealers be interested in hooking 10-year-old kids with free samples; all they would be doing is creating new patients for the HMOs. The dealers would eventually be forced to look for some alternative occupation, as did the bootleg liquor dealers of the past. At the present time, that would be better than the drug dealing they were previously into.

The win-win solution is plagued by psychological feasibility problems. Many do not believe that such availability will have any effect other than to increase the use of drugs. The idea that people who are not drug addicts would go to their HMO and say “I’m a drug addict, I’m on cocaine,” when they want to experiment is farfetched. Such a declaration would likely cause them to sacrifice many opportunities that they might otherwise have had—employers are not too enthusiastic about hiring drug addicts. The real drug addicts, though, would have an incentive to go to the HMOs. There they could get a maintenance prescription without having to rob or kill for it and without having to run the risk of getting arrested or killed.

This kind of approach appeals to some libertarian conservatives who think that a repression program involves more problematic government interference than interference in the economy. It should also appeal to liberals. It is better than legalization, because legalization means that controls would be much less strict, and that anybody could have access to drugs, including children. Those children would likely grow up to be much less productive members of society. Legalization, in fact, would have a very bad effect on national productivity, whereas this kind of program, which is only for confirmed drug addicts, would have few new effects. There are not going to be a whole lot of new drug addicts created, because there will not be a set of drug dealers encouraging the younger generation to become drug addicts.

As said before, the feasibility problem here is psychological. People are resistant to the idea of giving drugs to anyone, let alone those who are already addicts. That sounds somehow evil, but it is less evil than the present system might be. Because this plan is psychologically hard to accept, it is difficult politically to adopt. Economically, this solution would cost far less than what is currently being done. Cocaine, for instance, is very cheap to produce. Its high price largely has to do with police regression, which causes the costs of drug dealing to rise, and therefore, the street price to rise also. There might also be some feasibility problems with regard to administering such a program. The drugs possessed by the HMOs and hospitals must be carefully monitored so that they do not fall into the wrong hands. This can be taken care of by authorizing only one doctor in the whole HMO to prescribe drug maintenance programs or drugs. This would greatly decrease the amount

of people with access and would thereby decrease the risk. Also, in order to be eligible to receive a drug maintenance prescription, a person must be a confirmed addict. This would require testing, over time, of the levels of drugs in a person's system to see if they qualify. The administrative part of the program should not require people to accept a phase-out arrangement. Such restrictions would cause people to avoid the programs and would cause the formation of a black market, which defeats the purpose. That is why a similar program did not succeed in England. As long as these people are treated as sick people, not criminals, this kind of administration is likely to succeed.

PROSPERITY ANALYSIS: JOBS AND PRICES

Conservative Alternatives

Doing nothing is not likely to worsen unemployment or inflation, but it is also not likely to help. Decreasing the money supply and increasing interest rates may decrease inflation but increase unemployment. The same is true of decreasing government spending and increasing taxes. The Reagonomics approach involved decreasing taxes to stimulate employment and decreasing domestic spending to reduce inflation.

The Democratic counterpart as of 1980 was to increase employment through government jobs and decrease inflation through price control (Table 2).

Raising interest rates to decrease inflation may have the effect of decreasing prices by reducing spending from borrowed money. Those benefits may be more than offset by the undesirable effects on reducing the ability of business to borrow for expansion, inventory, and other purposes. The reduction in spending may also have an adverse effect on employment. Raising taxes and decreasing spending to fight inflation may not be politically feasible. It would also reduce the ability of the government to give tax breaks and well-placed subsidies to increase productivity.

Liberal Alternatives

Increasing the money supply and decreasing interests may stimulate employment but increase inflation. The same is also true of increasing government spending and reducing taxes. Lowering interest rates to decrease unemployment may have little impact, because businesses are reluctant to borrow when they are reducing their operations and sales are down. Likewise, consumers are reluctant to borrow when they are already heavily in debt and fearful of a reduction in employment or

hours. Lowering taxes and increasing spending to fight unemployment may not be politically feasible when the national debt and deficit are already too high.

A Win-Win Alternative

Increasing the adoption of new technologies and raising the skills of workers to help reduce inflation by increasing the productivity of labor to offset increased wages, increasing the quality of goods to offset increased prices, and increasing the gross national product (GNP) and domestic income to further offset increased prices.

Increasing the adoption of new technologies and raising the skills of workers helps reduce unemployment by making the workers more employable, increasing the GNP and domestic spending to stimulate the creation of more jobs, and increasing the productivity and wage rates, thereby offsetting a possible reduction in hours.

The conservative alternative of having interest rates up in times of inflation and down in times of unemployment does not make sense if inflation and unemployment are simultaneously problems. That would be so if both were over 3%. Likewise, the liberal alternative of having a budget surplus in times of inflation and a budget deficit in times of unemployment does not make sense when inflation and unemployment are over approximately 3%. One can, however, stimulate new technologies and upgrade skills when inflation and unemployment are occurring simultaneously.

PROSPERITY ANALYSIS: DISPLACED WORKERS AND FIRMS

Displacement of labor means displaced because of productivity downsizing, free trade, immigration, civilian conversion, and jobs for public aid recipients, and the disabled, the elderly, minorities, and women. The issue here is how to find jobs for displaced workers. The conservative emphasis is to leave it up to the recipient to find a job and not make it a responsibility of other people. The liberal emphasis is on the welfare agency or another government agency doing most of the job-finding work. The neutral position might involve delegating the activity to a non-profit organization (Table 3).

A key conservative goal is to save tax money. That means encouraging job finding to reduce welfare payments but not incurring high fees for job finding. A key liberal goal is to find jobs for displaced workers or welfare recipients, not just to save welfare payments, but also because jobs can increase the income, quality of life, and dignity of welfare recipients. Doing so also has effects that relate to multipliers, compounding, role models, and reducing illegal activities.

A superoptimum solution alternative is to contract out to a private profit-making firm at a commission of about \$X per welfare recipient who receives long-term employment. Half of the commission is paid after four months on the job and the other half after eight months. The firm is responsible for providing training, day care, employment leads, advice, and dispute resolution. This is a good example of contracting out. The profit motive stimulates more success in finding jobs than the rate of success by a government agency or a non-profit organization. The firm also has more capability than the recipient. Tax money is saved in the long run as a result of replacing welfare with work. It may also be saved in the short run by costing less money per long-term job found than the cost with a government agency or non-profit organization.

DEMOCRACY ANALYSIS: VOTING

Conservative and Liberal Position

The United States does not look good relative to the rest of the world when it comes to voter turnout. We have roughly (these are very round numbers) 200 million adults, of which approximately half are registered to vote. But, only about half of those who are registered to vote actually do. That is about 50 million. That means if just 26 million out of the 50 million vote for a certain candidate for president, he gets in. This can be a landslide if each state is hotly contested, even though it is only 26 million out of 200 million possible voters. It is not so good when, in effect, 12% of the population can decide who will sit in the Oval office. We are not undemocratic in the sense of prohibiting people, but less democratic than we should be in the sense of facilitating voter turnout (Table 4).

The true conservative goal might be to promote the election of conservative candidates, but that is not going to be said. What is actually said is that multiple voting should be avoided. Conservatives do not want any schemes that will allow cheating at the polls. Liberals on the other hand, are concerned about people who do not vote, so they want to decrease non-voting by adults who could be eligible. The conservative position promotes a decrease in multiple voting a number of ways. One of the most extreme positions is to purge the voter rolls every 10 years and make people register over again. This would guard against individuals still being present on the voter rolls who have moved or died. It greatly decreases the number of people who register if you have to do it over and over again. Having advanced registration may make a difference with regard to decreasing multiple voting, but it will also decrease voting in general. Liberals also want advanced

registration, but they want to make the process easier. They support ideas like postcard registration or registration at the time you get your driver's license, so-called motor-voter legislation. They also support keeping the polls open a few hours later to make it easier to vote on election day. Unfortunately, the liberal solutions in total would not make much of a difference, as more fundamental change is necessary.

A Win-Win Alternative

What really needs to be adopted is the kind of system presently being used in many countries of the world, including Canada, South Africa, Mexico, and Mozambique, and in states such as Wisconsin and Minnesota. It involves a few innovations. First, there is no requirement of advance registration. You can register in advance if you want to, but you can also register on-site the day of the election. Many people who do not vote on election day give as a reason the fact that they are not registered. If they could register on election day through on-site registration, that would no longer be a problem. Also, if elections were to be moved to a non-working day instead of a Tuesday, more people would be able to participate. In Catholic

countries like Italy, France, and Mexico, election day is on a Sunday, when people do not work. Other nations string their elections over a couple of days. Another improvement would allow people to vote in their home precinct or their work precinct, or even allow them to vote in any precinct, provided there is some way of checking to make sure they have not voted in another. Multiple-precinct voting can make a large difference in voter turnout.

With all of these facilitators, however, the conservative problem of multiple voting rises again. The way that problem is solved in South Africa, Mexico, Mozambique, and other countries, is by having voters dip their hand into a bowl of invisible ink. If you show up at a polling place anytime in the day after that, your hand is viewed under an ultraviolet lamp, and it will show that you have already voted. The invisible ink method works much better than asking people to sign their names, because names can be forged much more easily than hands. It is a good example of a win-win solution, because it would substantially decrease multiple voting and substantially decrease non-voting. It helps to achieve both kinds of goals simultaneously, like the previously mentioned outreach training, or the more cleaner profitable processes that relate to environmental protection and economic growth. All four that we

have discussed so far are capable of achieving the conservative and the liberal goals more successfully than the conservative or liberate alternative.

On-site registration, the non-working election day, multiple precincts, and the invisible ink method all have a political feasibility problem. This problem is political in the sense that it is difficult to get such measure through Congress or a state legislature. This is because one political party is likely to have enough strength to block it, namely, the party that thinks it will suffer as a result of expanded voter turnout. As long as it has enough power to stop these measures, they will never be adopted. If, however, they ever were adopted, they are not likely to be repealed. There is a kind of ratchet effect on new facilitators once they are adopted, because the party in power will look bad if it decreases the ability of people to register and vote. These measures are likely to be adopted when the Democrats have enough influence in the Congress or in the various state legislatures. The traditional thinking is that the Democratic party benefits more from expanded voter registration and turnout than the Republican party, due to the fact that a higher percentage of non-voters consist of the people who are poorer and less educated than average. Such voters are more likely to vote Democratic. The problem is political, but it may only be a temporary problem, as hopefully all the other feasibility problems may be temporary.

Win-Win Approaches to International Peace, Prosperity, and Democracy

Stuart S. Nagel

Political Science Department, University of Illinois, Urbana, Illinois, U.S.A.

INTRODUCTION

Win-win international studies involve applying win-win analysis to problems of international peace, prosperity, and democracy. Win-win analysis refers to analyzing a policy problem in such a way as to determine what alternative might be proposed that would enable conservatives, liberals, and other major viewpoints to all come out ahead of their best initial expectations simultaneously.

In this article, win-win analysis is applied to peace issues that relate to U.S. foreign policy since the Cold War and to relations between the United States and the United Nations. The analysis is applied to prosperity issues that relate to tariffs and exchange rates. The analysis is also applied to democracy issues that relate to promoting international democracy through trade and other means.

All of these applications view peace, prosperity, and democracy in an international or multinational context rather than in a domestic context. The peace problem may be the problem of domestic violence due to drug addicts seeking money to pay for drugs or seeking territory for the sale of drugs. The prosperity problem might deal with inflation and unemployment simultaneously. The democracy problem can be facilitating voter turnout.

WIN-WIN PEACE ANALYSIS

U.S. Foreign Policy Since Cold War

Cold War U.S. foreign policy divided conservatives and liberals. Conservatives tended to favor right-wing governments and large defense expenditures, whereas liberals tended to favor left-wing governments and lower defense expenditures. Now, both sides support lower defense expenditures and are less influenced by the economic ideology of foreign governments.

The prevailing conservative orientation seems more isolationist and less interventionist than the current liberal orientation. That is shown in the greater liberal support for intervention in Bosnia, Somalia, and other places where peace making or humanitarian aid might be appropriate. A compromise position would

advocate greater selectivity in the application of isolationism or peace making.

The key conservative goal seems to be to save taxes and promote domestic business. The key liberal goal seems to be to promote peace in the workplace and domestic employment opportunities.

A superoptimum solution might be to see peace as part of a larger international package. That foreign-policy package would include the United States actively promoting peace, prosperity, and democracy throughout the world in order to help all nations become better customers for the United States, suppliers to the United States, places for investment, and better world citizens. That kind of pragmatic policy would be mutually beneficial in increasing the national incomes and quality of life in the United States and elsewhere ([Table 1](#)).

Separate analyses could be developed. An important factor in promoting peace is supporting the United Nations' peace-making activities. An important factor in promoting prosperity is free trade in the movement of products, factories, and labor. An important factor in promoting democracy is the free movement of ideas through the mass media and providing financial and technical support for democratic forces inside and outside potentially dictatorial governments.

The United States and the United Nations

The key conservative goal in this context, relating to the role of the United States in helping the United Nations to bring peace to Bosnia, is to save U.S. dollars and save lives. The conservatives were not always so oriented toward isolation. They were very interventionist in the days of the cold war, especially with regards to curtailing the expansion of the Soviet Union. But at the present time, they espouse more of an isolationist policy and less of an intervention policy than do liberals. The conservative alternative for saving U.S. dollars and lives is to keep U.S. troops at home. They feel it is more important to develop the United States first. The liberals, on the other hand, are more oriented toward being the policemen of the world, traveling with the goal of promoting world

^d++ = The best of the alternatives on the goal after the superoptimum solution alternative is considered.

peace. More idealistic or maybe more naive, they believe what is sometimes referred to as a social worker ideology. That necessitates intervention.

The win-win solution saves U.S. dollars, U.S. lives, and promotes world peace simultaneously. An approach recommended by some who specialize in international relations is the idea of a volunteer U.N. force. What this would mean is that American troops would not be sent to Bosnia, Somalia, or anywhere else. The United Nations would have its own volunteer force, a force similar to the French Foreign Legion. It would consist of people from all over the world who would join partly out of idealism, partly because it pays some money. They would not be allowed to join unless they had some military experience or some aptitude for military training. It would provide an opportunity for Vietnam War veterans, Russian soldiers who had fought in Afghanistan, and others to participate in a force that would be devoted to a righteous cause. The officers would be officers who had served in the militaries of their various countries.

As a result, there would be no American soldiers in this U.N. force. There may be Americans in the U.N. force, but they would be Americans acting on their own. They would be volunteering to serve. They would not be drafted, or as in the case of the current Americans serving in Bosnia, ordered to go because their unit was called. They are not completely volunteers. These would be pure volunteers, pure in the sense they would be joining the U.N. force with the agreement to go wherever they are sent. If they will not go, for ideological or other reasons, then an option can be provided where they can quit. In such a case, it might be fair to have them pay back something in return for their training. Such an arrangement has many possibilities.

Such a plan has been opposed in the past by the United States because it was feared that the United Nations could not be trusted to have its own volunteer force. Strictly by the numbers, the United Nations in the past has been too much under the control of developing nations or nations under the control of the Soviet Union. But now, with the breakup of the Soviet Union, the United States dominates the United Nations as the only superpower in the world. The volunteer force could not be a threat to the United States. Though a bit behind in its payments, the United States is the leading source of funds to the United Nations, which further adds to its influence. If the United States does not like what the volunteer force is doing, it could just cut off the funding, use its veto power in the Security Council, or use its influence among countries of the world. This kind of volunteer force would mean that no American lives or American dollars would be used, yet it could still be effective in promoting world peace. It is possible that the volunteer force might call upon member countries to supply additional troops at some time, but this would be handled as the need arose. This represents another kind of win-win solution (Table 2).

The feasibility problem for this issue is psychological. It would be conceived that such a force might represent the muscle behind some type of world government that could partly deprive the United States or its sovereignty. Some might fear the volunteer force is going to march in and take over. As with all the other obstacles, it is necessary for this one to be overcome if this win-win solution is going to be adopted. People have to realize that a U.N. volunteer might not be a threat to them. In no way would the people with blue helmets serving in Bosnia invade the United States.

INTERNATIONAL PROSPERITY ANALYSIS

Tariffs

U.S. exporters and investors are helped by free trade with Mexico and other places because Mexicans can buy more U.S. products if there are no Mexican tariffs artificially raising the price of American products, Mexicans can buy more U.S. products if they have more income as a result of working in factories that have expanded as a result of American capital, and U.S. investors can make money and add to the U.S. gross national product by investing in Mexican factories that are now able to export better to the United States, because U.S. tariffs have been dropped.

U.S. consumers are helped by free trade with Mexico and other places, because they can buy products made in Mexico at lower prices, because they no longer have a U.S. tariff artificially raising the prices; they can benefit from low prices that should result from decreased labor expenses associated with some products made in Mexico, possibly stimulated with American capital; and U.S. consumers include business firms that buy producer goods less expensively from Mexico and thereby make American firms more internationally competitive.

U.S. firms and workers who are not sufficiently competitive would be hurt by the North American Free Trade Agreement (NAFTA), but this can be

minimized by retraining workers and firms so they can be more competitive in their old products or new products, making side agreements with Mexico that require upgrading of labor standards in Mexico, and helping disrupted workers and firms benefit from the increased prosperity of the U.S. as a result of more exporting, better overseas investing, and better buys for U.S. consumers.

Mexicans can benefit in the same ways as Americans by substituting for the three goal-columns: Mexican exporters and investors, non-competitive Mexican firms and workers, and Mexican consumers.

The opponents of NAFTA are referred to in [Table 3](#) as conservatives, and the advocates are referred to as liberals. That is done partly to simplify the calculation of the tools. It is also in accordance with the fact that conservatives have traditionally been in favor of high tariffs, although in recent years, that is less true than from about 1800 through the 1930s.

Exchange Rates

A high dollar value means that \$1 will buy many units of the currencies of other countries. A low dollar value means that \$1 will buy relatively few units of the currencies of other countries.

If the dollar has a relatively high value, then we have difficulty selling to other countries, because they have to give a lot of units of their currencies in order to get a dollar. If the dollar has relatively low value, then we have difficulty buying from other countries, because Americans have to give a lot of dollars in order to get the currencies of other countries.

If we concentrate on improving the quality and prices of American goods, then we can sell a lot of American goods to other countries without lowering the value of the dollar. A big effect of selling a lot more to other countries is an increase in the American national income. That enables us to have a lot more money to buy from other countries without raising the value of the dollar.

Thus, improving the quality and price of American goods through upgrading technologies and skills is a good superoptimum solution, because it can achieve both goals of increased buying and increased selling simultaneously. This is in contrast to manipulating the dollar, which increases one goal but decreases the other goal in a typical trade-off pattern ([Table 4](#)).

The superoptimum solution alternative also recognizes that trade, even without human rights conditions, can promote human rights by promoting prosperity and internal education. Democratic institutions can also promote prosperity and trade. There is thus reciprocal causation, even without explicitly linking the two.

Trade when used to encourage human rights needs to be presented more as a reward or bribe, rather than as a threat or punishment. Trade has worked well to encourage democratic institutions in places like South Africa. It can backfire if trade is withdrawn to the

point where extremists come to power (as in Russia), or to the point where the economy suffers long-term destruction (as could happen in Haiti).

Trade can also be used as a bargaining chip for other purposes besides human rights conditions, such

as tariff reductions and the opening of investment opportunities, which conservatives would also endorse.

WIN-WIN DEMOCRACY ANALYSIS

This analysis stems largely from the controversy over how far to go in withholding trade from China until human rights are given more recognition. The problem, however, applies to many countries that would like increased trade with the United States but lack a minimum level of domestic institutions.

The conservative position is to have trade without human rights conditions or prerequisites. The liberal position is to use trade to secure better human rights conditions, including the possibility of a pluralistic political system which allows two or more political parties to meaningfully compete for votes. A neutral position would think in terms of less substantial human rights, such as visits by Red Cross workers to political prisoners, but not ending political prisoners.

The conservative position is oriented toward American business profits. The liberal position is oriented toward spreading democracy. Both sides endorse each other's goals but not with equal weight.

The object of a superoptimum alternative would be to promote trade and human rights, partly through education and communication. That means encouraging students from China and other such countries to come to the United States. Doing so means they are more likely to return with American values like democracy. That also means increasing the communication of democracy-related ideas by way of radio, television, newspapers, books, and other forms of communication to China and other such countries.

The superoptimum alternative also recognizes that trade, even without human rights conditions, can promote human rights by promoting prosperity and internal education. Democratic institutions can also promote prosperity and trade. There is, thus, reciprocal causation, even without explicitly linking the two.

Trade when used to encourage human rights needs to be presented more as a reward or bribe, rather than as a threat or punishment. Trade has worked well to encourage democratic institutions in places like South Africa. It can backfire if trade is withdrawn to the point where extremists come to power (as in Russia), or to the point where the economy suffers long-term destruction (as could happen in Haiti).

Trade can also be used as a bargaining chip for other purposes besides human rights conditions, such as tariff reductions and the opening of investment opportunities, which conservatives would endorse also (Table 5).

Win-Win Policy

Stuart S. Nagel

Political Science Department, University of Illinois, Urbana, Illinois, U.S.A.

INTRODUCTION

Win-win policy refers to public policy that is capable of achieving conservative and liberal goals simultaneously. Examples could be given from any field of public policy, such as economic, social, environmental, legal, or political policy. Win-win policies should be distinguished from compromises, where both sides retreat partially from achieving their goals in order to obtain an agreement.

AN EXAMPLE IN THE FIELD OF ENVIRONMENTAL POLICY

As an example, the field of environmental policy involves conservative and liberal approaches. Conservatives emphasize the role of consumers and the marketplace in restraining business from engaging in socially undesirable activities, like pollution. The liberals emphasize the role of the government in restraining pollution. Conservatives are especially interested in the goal of economic development, which may be interfered with by governmental restraints. Liberals are especially interested in the goal of a cleaner environment, which may not be achieved so effectively by relying on selective consumer buying.

A neutral compromise approach might involve giving business firms partial subsidies to adopt antipollution devices. Doing so would involve some requirements for receiving the subsidies but less interference than regulation and fines. Doing so would help promote a cleaner environment, but there still might be evasions by business in view of the extra expense and trouble in complying.

A win-win policy alternative instead might emphasize subsidies to universities and research firms to develop new processes (that relate to manufacturing, transportation, energy, and agriculture) that are less expensive and cleaner than the old processes. Those new processes then would be adopted by business firms, because they are more profitable, not because the firms are being forced or subsidized to do so.

The new processes thus would achieve the conservative goals of profits and economic development, even better than retaining the present marketplace. Such a win-win policy also would promote the liberal goal

of a cleaner environment, even better than a system of regulation, and without the expense of a continuing subsidy for adopting and renewing antipollution devices.

A specific example of such an environmental win-win policy has been finding a substitute for aerosol propellants and air-conditioning freon that is more profitable to manufacturers and simultaneously less harmful to the ozone layer, which protects against skin cancer. Another specific example is developing an electric car, which saves money on gasoline and maintenance, while at the same time, does not generate the exhaust pollution of internal-combustion cars. Developing hydrogen fusion or solar energy also may be examples of less expensive and cleaner fuels for manufacturing processes.

KINDS OF FEASIBILITY

Win-win policies may be capable of achieving conservative and liberal goals in theory but not in practice. To be meaningful policies, they may have to satisfy various kinds of feasibility. For example, is the policy of developing solar energy for manufacturing feasible technologically? Is there sufficient funding available to subsidize the needed research if the private sector is not so willing, due to the risks, the large amount of money needed or the long wait before payoffs occur?

Is there insurmountable political opposition from liberals who do not like government subsidies to make business more profitable? What about the opposition from conservatives who do not like government involvement in developing a research agenda? Is the program feasible administratively in terms of built-in incentives, or does it require a lot of obtrusive monitoring? Does the program violate some constitutional rights? Does the program make provision for workers and firms that might be displaced if the policy is adopted?

CREATIVITY

Win-win policies may involve creativity, but developing them is becoming easier as a result of experience

with the ideas. We now have many different approaches that can serve as a checklist in leading one to a win-win policy. For example, expanding the resources available can enable conservatives to have more money for defense and liberals to have more money for domestic programs. The government sometimes can be a third-party benefactor in providing vouchers to enable landlords and tenants, and also merchants and consumers, to come out ahead.

One also can deal with problems like abortion by getting at the causes. These causes consist of unwanted pregnancies that could be lessened through more effective abstinence programs and birth control. Thinking in terms of the goals to be achieved, rather than the alternatives to choose among, can stimulate win-win policies. Thinking in terms of increasing benefits and decreasing costs can also lead to win-win policies.

Other approaches deal with early socialization of widely accepted values, technological fixes like the non-polluting hair spray, and the contracting out of government activities to private firms (which do well as a result of the profit motive and quality specifications in the contract). Further approaches may involve combining (rather than compromising) alternatives, developing a package with something for each major viewpoint, having international economic communities, adopting a gradual or incremental win-win policy, and arranging for big benefits on one side with small costs on the other.

Win-win policy may be especially relevant as of 1994–1995, because the Democrats control the presidency and the Republicans control Congress. That division means that neither purely liberal nor purely conservative legislation is likely to pass in view of the Republican congressional majority, the availability of the filibuster to the Democrats in Congress, and the availability of the veto to the president. It is possible that some compromise legislation might pass, such as health care without an employer mandate or required forms of health insurance. Even better would be win-win policies, such as promoting real economic growth through greater productivity related to increasing labor skills, new technologies, competition, and tariff reductions.

STEPS AND CHECKLISTS

Win-win policy analysis in this context can be defined as handling policy problems by finding solutions that exceed the best initial expectations of conservatives, liberals, Republicans, Democrats, or whoever are the major groups, sides, or viewpoints in the policy dispute. Win-win is also called superoptimizing or doing better than the previous best of all major groups.

There are basically five steps to win-win policy analysis:

1. What are the major goals of conservatives, liberals, or other major groups who are disputing what policy should be adopted for a given policy problem?
2. What are the major alternatives of these groups for dealing with the policy problem?
3. What are the relations between each major alternative and each major goal? In their simplest form, these relations can be expressed in terms of a minus sign (relatively adverse relation) and plus sign (relative conducive relation), and a zero (neither adverse nor conducive relation).
4. What new alternative is there that might be capable of the following:
 - a. Achieving the conservative goals even better than the conservative alternative.
 - b. Simultaneously capable of achieving the liberal goals even more than the liberal alternative. Whatever new alternative meets these two criteria is a win-win alternative or a superoptimum solution.
5. Is the proposed win-win alternative capable of getting over various hurdles that frequently exist. These hurdles may be political, administrative, technological, legal, psychological, and economic in random order. Win-win solutions should also consider how to upgrade workers and firms that may be displaced by downsizing due to increased productivity, free trade, defense conversion, immigration, merit treatment, labor utilization, creativity, and related factors.

To facilitate developing win-win alternatives, it helps to have a positive can-do attitude that it can be done. It also helps to have a checklist of types of win-win alternatives that have worked in the past. Such a facilitating checklist of types might include the following:

1. Expand the resources.
2. Find a third-party benefactor.
3. Set higher goals.
4. Decrease the causes of the problem.
5. Redefine the problem to emphasize goals rather than alternatives.
6. Increase the benefits and decrease the costs.
7. Socialize children in widely accepted values so the problems do not occur.
8. Find a new technology.
9. Contract out via an auction to multiple firms with societal strings attached.

10. Promote international economic communities.
11. Arrange for big benefits on one side and small costs on the other.
12. Fully combine alternatives that are not mutually exclusive.
13. Develop a multifaceted package.
14. Adopt the win-win solution in steps, where the first step may be a traditional compromise.

Win-win analysis can be applied to handling dissident faculty as an example:

1. A lose-lose situation is where a department or the university seeks to destroy a dissident faculty member. The university may suffer the stigma of being enjoined for violating free speech and due process. The faculty member loses money in obtaining an injunction and subsequent enforcement.
2. A win-lose situation is where one side thinks it can be a winner and the other side a loser. Trying to reach this point often results in a lose-lose situation, as in litigation, strikes, and war.
3. A win-win situation is where the university can try to constructively encourage the potential creativity of dissident faculty. Doing so can possibly result in new ideas, inventions, and institutions to the credit of the university and the dissident faculty members. This is more likely to happen with administrators who have flexible democratic personalities rather than authoritarian personalities. All administrators, however, benefit from the funding, prestige, and quality students that go to universities that are in the forefront of new ideas, inventions, and institutional arrangements.
4. The same win-win thinking can be applied to dissident citizens in a country. The analysis is also applicable to other economic, technology, social, political, international, and legal policy problems.

WIN-WIN MATRIX

Finding solutions where all major sides achieve better than their best expectations is the goal of a win-win policy.

The win-win matrix in Table 1 indicates that basic win-win analysis is about as simple as a tic-tac-toe table. A tic-tac-toe table has three columns made by two vertical lines. It also has three rows made by two horizontal lines. That is also true of a win-win table, except it adds a fourth row for superoptimum solutions.

Table 1 Generic win-win matrix

Policies	Goals	
	Conservatives	Liberals
Conservatives	+ ^a	—
Liberals	— ^b	+
Superoptimum Solutions	++ ^c	++

^a+ = The alternative is relatively conducive to the goal.

^b— = The alternative is relatively adverse to the goal.

^c++ = The best of the alternatives on the goal after the superoptimum solution alternative is considered.

The first row indicates the types of goals to be achieved. The second column refers to conservative goals, and the third column refers to liberal goals. The first column indicates the types of policy alternatives under consideration for achieving the goals. The second row refers to conservative policies, and the third row refers to liberal policies.

A “+” sign indicates that the policy is relatively conducive to the goal in comparison with the other policies being considered. A “—” sign indicates that the policy is relatively adverse to the goal. Conservative policies usually do well on conservative goals but not so well on liberal goals, as one would expect. Liberal policies do well on liberal goals but not so well on conservative goals.

This is a classic trade-off, where adopting either of the two policies means losing some of the goals. The result is usually a compromise, whereby both sides (or all major sides) lose something and gain something. Neither side is usually strong enough to impose its solutions.

A win-win or superoptimum solution involves finding an alternative that is not purely conservative, purely liberal, or a compromise. It is, however, capable of achieving the conservative goals more than the conservative policies, and simultaneously capable of achieving the liberal goals more than the liberal policies.

The superoptimum solution thus receives a “++” on the conservative and liberal goals. In that sense, it does better than the conservative best and better than the liberal best. It should also be feasible regarding economic, technology, social, psychological, political, administrative, and legal matters.

AN EXAMPLE OF THE MATRIX

Table 2 applies the generic win-win matrix to the problem of environmental protection, especially in developing nations. The main conservative goal is economic development, and the main liberal goal is a clean environment. Conservatives also endorse a clean environment but not as much as liberals. Likewise,

Table 2 Economic development versus a clean environment

Alternatives	Criteria	
	Conservative Economic development	Liberal Clean environment
<i>Conservative</i> Marketplace	+ ^a	–
<i>Liberal</i> Antipollution regulation	– ^b	+
<i>Neutral</i> Compromise regulations	0 ^c	0
<i>Superoptimum solution</i> Improved manufacturing, agricultural, and other processes (more profitable and cleaner)	++ ^d	++

^a+ = The best of the alternatives on the goal before the superoptimum alternative is considered.

^b– = The alternative is relatively adverse to the goal.

^c0 = Neither conducive nor adverse.

^d++ = The best of the alternatives on the goal after the superoptimum solution alternative is considered.

liberals also endorse economic development, but not as much as conservatives.

The main conservative policy is to rely on the marketplace on the theory that consumers would not buy products that are causing unhealthful pollution. The main liberal policy is to rely on antipollution regulation on the theory that the fines, taxes, and other penalties will cause business to reduce pollution.

The usual result consists of compromise regulations that are not as severe as liberals would like but are better than nothing. The compromise regulations are not as desirable to business as no regulation, but they are better than what the liberals are advocating.

A win-win or superoptimum solution might involve public policy working through financial and other positive incentives to generate new processes for manufacturing, agriculture, transportation, and energy that are more profitable to business but at the same time cleaner to the environment than previous processes. Such a profitable and clean policy would be an improvement on economic development and a clean environment.

An example might include the use of vehicles and machines that use less gasoline and oil but are even more productive. Such innovations are easier in terms of technology, funding, and other considerations for some kinds of pollution. Such innovations may also have a bigger impact on some kinds of pollution. The optimum allocation of incentive money is, however, a separate problem. The important consideration here is shifting conservatives and liberals toward such

**Fig. 1** Federal budget deficit as a percent of gross domestic product.

win-win solutions, rather than toward relatively ineffective marketplace and regulatory policies.

SUEROPTIMUM SOLUTIONS APPLIED TO ECONOMICS

Economists (especially Keynesian economists) have argued that an expanding economy requires (or generally requires) deficit spending in order to stimulate the economy. If the government spends more than it taxes (an undesirable occurrence), then gross national product (GNP) goes up (a desirable occurrence).

Deficits are undesirable, because they cause government borrowing which raises interest rates and hurts the economy; inflexibility in needed government spending, because so much of the budget goes to pay interest on the debt; and a class of relatively unproductive people who live off unnecessary interest paid by taxpayers. An increased real GNP is desirable, because it means more jobs, higher wages, more funds available for education and other worthwhile government programs, and improved quality of life via private purchasing.

Traditional trade-off thinking says we must accept undesirable costs to get desirable benefits. Win-win

**Fig. 2** Percent change in gross domestic product.

I. Inputs

ALTERNATIVES	X1	4	2	6	10	14
	X2	3	5	8	11	14

Fig. 3 Basic concepts in general policy analysis.

thinking says we can avoid the undesirable costs of big deficits and still have economic growth. Fig. 1 shows deficits turning into surpluses as of 1998. Fig. 2 indirectly shows recent GNP growth from under \$5 trillion in 1990 to over \$7 trillion in 1998, at an increasing rate of growth.

This win-win occurrence comes about through improved technology, training, competition, free trade, and public policy. Those factors cause increased GNP. An increased GNP enables the government to have increased revenue from income taxes and have decreased welfare costs. Those two factors lower the deficit, especially as a percent of the GNP.

Readers should not think that win-win analysis is biased against liberal economists like Keynes. For example, the Phillips Curve is associated with

conservatives who say we have to suffer unemployment in order to avoid inflation. The autumn 1996 issue of *Policy Evaluation* shows unemployment decreasing in the 1990s to a generation low of 4.3% and inflation simultaneously decreasing to under 1%, which is almost nothing.

COMPARED TO GENERAL POLICY ANALYSIS

The following should be considered when viewing the basic concepts in general policy analysis as shown in Fig. 3:

1. It may be highly questionable as to whether the policy analyst has used alternatives, goals,

I. INPUTS			
1. <u>Goals</u>	C, L, N		
2. <u>Alternatives</u>	C, L, N		
3. <u>Relations</u>	Just +, 0, or -		
II. PROCESSING			
		GOALS	
		C	L
ALTERNATIVES	C ^a	b	d
	L ^a	+	-
	N ^a	-	+
	0 ^c	0	0
III. OUTPUTS			
		SOS ^a	e
		++	++

^a C = conservative ; L = liberal ; N = neutral ; SOS = superoptimum solution.

^b + = The alternative is relatively conducive to the goal.

^c 0 = Neither conducive nor adverse.

^d - = The alternative is relatively adverse to the goal.

^e ++ = The best of the alternatives on the goal after the superoptimum solution alternative is considered.

Fig. 4 Basic concepts in win-win or superoptimum solution analysis.

weights for the goals, and relations between alternatives and goals, on which large-scale agreement can be obtained.

2. The results are highly sensitive to the subjective alternatives, goals, weights, and relations.
3. The totals to the right are calculated with Y2 having a weight of 1, and Y1 having a weight of 1, 2, or 3.
4. Processing steps for Figs. 1 and 2 are as follows:
 - a. Decide on winning alternative:
 - i. Which one is best?
 - ii. Which combination is best?
 - iii. What is the best allocation?
 - b. Hurdles to overcome include economic, political, administrative, legal, psychological, technology, displaced workers, and firms.
 - c. "What if" analysis.
2. It is logically assumed that conservative alternatives have a relatively positive relation with conservative goals and a relatively negative relation with liberal goals, and vice versa for liberal alternatives. It is also logically assumed that conservatives give greater weight to conservative goals than to liberal goals, and vice versa for liberals.
3. With that reasonably objective information, one can deduce alternatives that are objectively win-win. If the win-win alternative dominates both sets of goals, then it makes no difference how the goals are weighted or totaled.

Basic concepts in win-win or superoptimum solution analysis are shown in Fig. 4. The following should be noted:

1. The alternatives, goals, and weights for the goals are given by conservatives and liberals in congress, the courts, the newspapers, or elsewhere, rather than imposed by the policy analyst.

Work Motivation

Hal G. Rainey

Department of Political Science, University of Georgia, Athens, Georgia, U.S.A.

INTRODUCTION

Motivation is one of the central topics in the social sciences, and work motivation plays a similarly central role in the research and practice of administration. Work motivation has received intensive theoretical development, and scholars have reported thousands of studies bearing on the topic. Scholars still struggle with definition, and reviews of the research have located over 100 distinct definitions. For present purposes, however, we can say that work motivation refers to how much a person tries to work hard and work well—to the arousal, direction, and persistence of effort in work settings.

MEASURING MOTIVATION

Motivation researchers have also struggled with different ways of measuring motivation, such as through questions on questionnaires asking people about how hard they work and how often they do some extra work. Generally, efforts to employ measurement methods such as these have not led to a consensus about a most effective procedure for measuring motivation. Researchers also employ scales of intrinsic or internal work motivation. Intrinsic work motives or rewards include those mediated within the worker, such as feelings of accomplishment, growth, and self-esteem through work well done. Extrinsic rewards are externally mediated, and are exemplified by salary, promotion, and other rewards that come from the organization or work group.

Additional Influences on Performance

Writers on work motivation also emphasize that motivation alone does not determine performance. Other factors influence performance, including ability, understanding of the task, behaviors of leaders or coworkers that can confuse or clarify, the availability of resources, and the adequacy of training. This seemingly simple point takes on great importance when superiors inaccurately attribute performance problems to subordinates' weak motivation, when in reality, the problems stem from some of these other causes.

Motivation as an Umbrella Concept

Some scholars have concluded that these complexities have moved the concept of motivation into the status of an umbrella concept that refers to a general topic rather than a precisely defined and measured research variable. They employ the term as referring to a general concept incorporating many variables and issues, such as organizational commitment, leadership practices, job involvement and intrinsic work motivation, organizational climate and culture, characteristics of work goals, and others.

THEORIES OF MOTIVATION

Theorists have developed many theories of work motivation. None explains motivation comprehensively, but each contributes an important component of a well-developed conception of motivation and its determinants and outcomes. The following examples illustrate the most prominent theories. They include the group of theories often called the content theories, that emphasize the needs and motives that serve as contents of the motivational process. This group includes Maslow's need hierarchy, Herzberg's two-factor theory, McClelland's theory of the need for achievement, and equity theory. Process theories, in the second category, do not posit particular needs or motives but rather model the psychological and behavioral processes in motivation. They include expectancy theory, operant conditioning theory, social learning theory, and goal-setting theory.

Maslow's Need Hierarchy

The psychologist Abraham Maslow proposed an influential theory—human motives or needs follow a hierarchy of prepotency, as he put it. Basic, lower-order needs dominate human motivation until they are satisfied. Then, needs at the next higher level dominate, and so on up the hierarchy to the higher-order needs, such as the needs for esteem and ultimately for self-actualization. Some details help illustrate the hierarchy. Once one has satisfied such physiological needs as hunger and the need for sleep, one becomes more concerned with the next step up the hierarchy, the

safety and security motives. Next, needs for social and love relationships dominate. With those needs reasonably satisfied, needs for esteem dominate. The highest-order need, for self-actualization, or the striving to maximize one's potential and fulfill aspirations, became Maslow's most influential concept. In his writings, Maslow argued that genuinely self-actualized persons achieve this ultimate mode of satisfaction through dedication to a duty or mission that benefits others or society in general.

Herzberg's Two-Factor Theory

Frederick Herzberg (1968) proposed one of the best-known analyses of motivational issues in his two-factor theory. From many studies of workers in organizations, he concluded that two major factors influence individual motivation in work settings—"motivators" and "hygiene factors." The distinction is critical. The absence or insufficiency of hygiene factors can contribute to dissatisfaction with the job, but the presence of hygiene factors does not stimulate high levels of satisfaction. Hygiene factors are extrinsic to the individual and include organizational, group, or supervisory conditions, or externally mediated rewards such as salary. While hygiene factors can only prevent dissatisfaction, the motivators produce a heightened level of satisfaction and increased motivation. Motivators are intrinsic to the job and include interest and enjoyment of the work, as well as a sense of growth, achievement, and fulfillment of other higher-order needs. Herzberg concluded that because motivators provide the real sources of stimulation and motivation for employees, managers must arrange job settings to provide for the growth, achievement, recognition, and other needs represented in the motivators.

McClelland: Needs for Achievement, Power, and Affiliation

David McClelland's theory about motivations for achievement, power, and affiliation has inspired thousands of studies. Need for achievement, the central concept in his theory, refers to a motivation to achieve a sense of mastery over one's environment, through success at achieving goals and outcomes through one's own cunning, abilities, and efforts. McClelland originally argued that motivation for achievement in this pattern was characteristic of persons attracted to managerial and entrepreneurial roles, but he later narrowed its application to predicting success in entrepreneurial roles. McClelland measured need for achievement through a variety of procedures, such as psychological tests and questionnaire measures. He concluded that persons high in this need choose

reasonably challenging goals and moderate risks, where outcomes are fairly clear and accomplishment reflects success through one's own abilities. McClelland claimed that need for achievement related to success in certain types of business activities and even to economic success of nations.

Equity Theory

J. Stacy Adams developed a theory about a motive for equity in organizations that makes people want to feel equitably compensated. People have a need for a sense of equity and are uncomfortable with evidence that they are inequitably compensated. They compare their own exchanges with the organization to the exchanges between the organization and other employees. If a person senses that treatment received is inequitable in comparison with others, that person will be motivated to reduce the inequity. The person may respond to inequity in various ways—by altering inputs or outcomes, mentally distorting one's inputs and outcomes, acting on the referent person (such as pressuring the person to produce more or less), or leaving by transferring or quitting.

Expectancy Theory

This theory of work motivation draws on the classic observation, attributable to various philosophers and social scientists, that humans seek to do what they think is most likely to maximize desirable results and to minimize bad results. The psychologist Victor Vroom brought this theory to prominence with an effort to formalize this time-honored observation into a mathematical formula. His formulation posited that an individual will be more strongly motivated to engage in a behavior as probabilities ("expectancies") that the behavior will lead to valued outcomes and avoid bad outcomes are perceived to be stronger. In other words, if a behavior is likely to lead to some desirable results (more pay, more interesting work) but also is likely to lead to some undesirable results (more overtime work, more stress), one's motivation to engage in the behavior will depend on just how desirable or undesirable one considers the results, and on one's sense of the likelihood of each result. Expectancy theory appeared to offer an advancement in conceiving and analyzing motivation. Organizational psychologists sought to apply it by developing questionnaires that ask employees about the likelihood of a set of outcomes (e.g., a pay raise, a promotion) from their work behaviors (such as "doing high-quality work"). The questionnaire also asked about their positive or negative valuations of the outcomes. The psychologists then developed a score for each

employee by multiplying the employee's perceived probabilities of each outcome by the employee's valuation of that outcome, and summing these products. They hoped this sum would serve as an indicator of that person's motivation.

Also fairly rapidly, problems in applying and validating the theory mounted, along with questions and criticisms. Researchers found the component constructs hard to clearly define and operationalize. All of these problems soon deflated any dramatic hopes for the theory, and theorists set about developing revised versions. They tend to state the theory as a general conceptual framework without clear postulates as to how the component constructs are supposed to be combined. Newer formulations also distinguish between *Expectancy I*, or the person's perceived probability that a given level of work effort will lead to a certain level of performance, and *Expectancy II*, the person's perceived probability that the attainment of that level of performance will lead to outcomes. These two expectancies, together with the values of the outcomes, determine motivation. The more recent versions also add other variables to the framework, such as task clarity, self-esteem, and performance assessment procedures, which can influence Expectancy I, and organizational compensation procedures, which can influence Expectancy II. In spite of the limitations of this theory, nonetheless, scholars are attempting to further develop motivation theories that typically employ expectancy theory concepts.

Operant Conditioning Theory and Behavior Modification

Theorists have also drawn on operant conditioning theory as a basis for analysis of work motivation. Operant theory derives from what psychologists have called the "behaviorist" school in psychology, which heavily emphasized the analysis of observable behaviors, and de-emphasized what goes on inside the individual. They analyzed the ways in which external influences "reinforce" or increase behaviors, and how, on the other hand, lack of reinforcement leads to "extinction" of the behavior. This interest in shaping behaviors provided the foundations for later development of behavior modification techniques in therapeutic, educational, and managerial applications. Programs of managerial applications have sometimes been referred to as organizational behavior modification programs.

The operant conditioning theorists developed concepts and principles of reinforcement that influenced later efforts to apply this type of theory in administrative settings, some of which have become

part of everyday parlance. Positive reinforcement applies a stimulus that increases the behavior on which it is made contingent. We receive payment for taking an action, and our tendency to take that action increases. Negative reinforcement increases the behavior on which it is made contingent through removal of the stimulus or condition. Operant theorists also distinguished between various patterns of reinforcement, such as how frequently and regularly a reinforcement is applied. They concluded that positive reinforcement provides the most efficient means of influencing behavior, and that punishment is less efficient and effective in shaping behavior. They usually concluded that a behavior is acquired most rapidly through frequent, regular reinforcement. A behavior reinforced with that schedule, however, will extinguish more rapidly once reinforcement is discontinued, than will a behavior that has been reinforced less frequently and regularly. This leads some behavior modification proponents to prescribe such managerial techniques as *not* praising a desired behavior constantly but on a varying basis after a number of repetitions.

This prescription serves as an example of those offered by practitioners of organizational behavior modification, which applies versions of operant conditioning theory in organizations. Organizational behavior modification often involves approaches such as measuring and recording desirable and undesirable behaviors to establish baselines, determining the antecedents and consequences of the behaviors, and determining a strategy for using reinforcements and punishments—such as praise and pay increases—to apply to the behaviors. In spite of some reports of successful programs, this approach has sharp critics and has not been widely applied.

Social Learning Theory Perspectives on Motivation

Albert Bandura has led the development of social learning theory that has influenced contemporary views of work motivation. The theory emphasizes forms of learning and behavioral change that are not tied tightly to some external reinforcement. Humans can engage in vicarious learning, anticipation, mental rehearsal and imagery, and self-rewarding behaviors (praising oneself). Applications of such processes to organizational settings have mainly involved the development of frameworks for leadership and self-improvement, using the processes mentioned above to improve performance and to enhance a person's self-efficacy. Self-efficacy refers to a person's task-specific confidence and sense of capability in accomplishing task outcomes.

Goal-Setting Theory

Edwin Locke and colleagues advanced a theory of goal setting that many reviewers have acknowledged as the most successful work motivation theory in gaining validation through well-designed research. The theory holds that difficult, specific goals to which the persons pursuing them feel a commitment, lead to higher task performance than easy or vague goals or no goals (e.g., “do your best”). The theory posits that difficult goals enhance performance by directing attention and action, mobilizing effort, increasing persistence, and motivating the search for effective performance strategies. Many studies support the basic tenets of the theory by finding that difficult, specific, accepted goals enhance task performance. One reason for the success of the theory, however, may be its compactness and relatively narrow focus on task accomplishment, often on relatively simple tasks.

RECENT THEORETICAL DIRECTIONS: INTEGRATION AND SEPARATION

Reviewers tend to agree that motivation theory is in a disorderly state. Recent proposals and initiatives for the further development of motivation theory emphasize the integration of existing theories, or they emphasize the separateness of theories, while recognizing how each theory is useful, or they emphasize some degree of integration and separateness. Recently, scholars proposed models of motivation that integrated elements of expectancy and goal-setting theory with elements of other psychological theories, such as control and attribution theory. Other recent models bring together major concepts related to motivation, including individual dispositions, needs, goals, expectancies, self-efficacy, fairness, rewards, social influences, and job design.

MOTIVATION PRACTICE AND TECHNIQUES

While theorists continue the search for theories and concepts of motivation, organizations need to motivate their members, and they take many approaches to doing so. Well-administered organizations develop well-designed performance appraisal systems. They seek well-designed compensation systems including, as appropriate, merit pay and pay for performance systems, skill-based pay, cafeteria-style benefit plans (that allow choices among benefits), work group or team-based incentives, and profit-sharing and gain-sharing programs. They utilize bonus and award systems that offer one-time awards for excellent performance or other achievements. They may use Management by Objectives and other performance targeting procedures. They recognize the value of participative management and decision making in motivating employees. They use work enhancement techniques for effective job design and enrichment. As appropriate, they initiate organizational development (OD) interventions that apply behavioral science techniques to improving such processes as communication, conflict resolution, and trust. An effectively managed organization also strives to develop an organizational culture and mission that motivates employees toward high performance.

Working Capital

Justin Marlowe

Department of Public Administration, University of Kansas, Lawrence, Kansas, U.S.A.

INTRODUCTION

The long-term viability of any public organization is heavily dependent on that organization's effective use of working capital. Working capital provides operations managers with financial resources to meet short-term obligations, generate interest income through short term investments, take advantage of discounts and other limited-term procurement opportunities, and address many other day-to-day concerns. Moreover, sound working capital management practices can free up cash during tough fiscal times, thus mitigating the need for costly short-term borrowing. Working capital management is therefore one of the central concerns facing public financial managers. This chapter examines working capital from both an accounting and a financial managerial perspective.

THE ACCOUNTING PERSPECTIVE ON WORKING CAPITAL

The fundamental equation of accounting states that the difference between an organization's assets and liabilities is known as owners' equity.^[1] Since public sector organizations do not necessarily have owners or shareholders, the government and nonprofit variant of this basic equation labels the difference between assets and liabilities "net assets." This equation is expressed as

$$\text{Assets} - \text{Liabilities} = \text{Net Assets} \quad (1)$$

The difference between an organization's total assets and liabilities provides important insights into its ability to meet long-term obligations. Nonetheless, operations managers are primarily concerned with the organization's ability to meet current rather than long-term obligations. This emphasis on current financial condition is reflected in the prevailing governmental accounting model, which distinguishes current assets and liabilities from long-term assets and liabilities. Current assets such as cash, marketable securities, accounts receivable, and the liquid assets associated with or capital projects are accounted for in one of a number of "funds" such as the general fund, debt service fund, and capital projects fund. The difference between current assets and current

liabilities within each fund is known as "fund balance." This relationship is expressed as

$$\text{Assets} = \text{Liabilities} + \text{Fund Balance} \quad (2)$$

Because of the public sector accounting model's focus on current assets, fund balance is considered by many to be synonymous with working capital.^a Working capital is often cited as an important indicator of an organization's financial condition. Like many other indicators, such as the current ratio, it is often expressed as a percentage of current expenditures. An organization with a working capital ratio of 1:1 holds enough liquid assets to cover its current liabilities.^[3]

THE MANAGEMENT PERSPECTIVE ON WORKING CAPITAL

"Working capital management" is a term broadly construed to mean the management of current, short-term, or idle financial resources. The primary objective of a working capital management strategy is to maximize the productivity of working capital in accord with organizational objectives. There are three schools of thought on how to most effectively match resources with objectives.

The first suggests a sizable working capital reserve is necessary in order to take advantage of discounts and other short-term procurement opportunities, to prevent fees resulting from late payment of liabilities, and to protect against catastrophic losses resulting

^aThis relationship between fund balance and working capital is contingent upon an organization's choice of accounting methods. In organizations that use modified accrual accounting, fund balance represents the difference between current assets and liabilities and is thus a good indicator of available working capital. But many organizations use a cash, modified cash, budgetary, or some other comprehensive basis of accounting (OCBOA) method that focuses on resource inflows and outflows rather than current financial resources. In these organizations, working capital is synonymous with the available cash on hand, remaining appropriation, or some other measure of available financial resources. OCBOA methods typically do not receive nearly as much attention from accounting practitioners and academics as generally accepted accounting principles (GAAP), despite recent estimates that anywhere from one-third to two-thirds of all small municipal governments in the United States use OCBOA. For a further discussion of OCBOA and its related issues, see Ref.^[2].

from natural disasters and other unforeseeable events. Proponents of this view also suggest working capital provides organizations a pool of financial resources that can be used to meet debt service obligations during tough fiscal times. In turn, credit analysts look favorably upon large working capital reserves and reward effective working capital maintenance with higher bond ratings. Given these numerous advantages, organizations are encouraged to be liberal with the size and use of their working capital reserves.

An opposing perspective suggests working capital is a drag on productivity. Rather than contributing to the production of public goods and services, it instead conceals stale, unmarketable inventory, accounts receivable that may not be realized, unnecessarily quick payment of outstanding liabilities, and other slack resources should be minimized or eliminated whenever possible. Proponents of this view recognize certain business processes inevitably require some working capital, but are also quick to argue any and all idle working capital reserves are most productive when placed in short-term investments. Therefore, they claim, organizations should minimize and invest working capital reserves whenever possible.

Most public organizations, due to their missions and responsibilities, cannot afford wholesale implementation of either of these strategies. The fact that many public organizations must be prepared for worst-case scenarios such as natural disasters, terrorist attacks, fiscal downturns, and the like suggests that aggressive inventory reduction strategies may carry unacceptable levels of risk. Public organizations also rarely have the same breadth of choices among competing vendors, which greatly inhibits their ability to manage when and how goods and services will be delivered.

These and other considerations suggest a third or compromise working capital strategy characterized by the maintenance of a wide variety of working capital resources for an equally wide variety of strategic purposes. That strategy was best articulated by Shelton, Tyer, and Hembree,^[4] who suggest that public organizations ought to maintain four different types of working capital reserves:

1. Transaction balances—which allow organizations to realize economic gains by paying bills quickly and taking advantage of trade credits.
2. Compensating balances—which improve an organization's standing with banks and other financial institutions by increasing the amount of money those financial institutions have available for lending.
3. Speculative balances—which allow an organization to take advantage of near-term procurement and other opportunities.

4. Precautionary balances—which provide necessary protection against economic downturns and other fiscal shocks.

Public financial managers, according to Shelton and Tyer, are most concerned with speculative and precautionary balances. Speculative balances are often maintained in the form of reserved and designated fund balance. By designating resources for a particular use, managers can practice effective working capital management while ensuring transparent and accountable use of public funds. Precautionary balances are often equated to undesignated fund balance, which is largely a function of bond raters' stated desire for residual resources that can be used to meet debt service obligations during tough fiscal times.

WORKING CAPITAL CREATION AND MAINTENANCE

Although there are divergent perspectives on how to maximize working capital productivity, there is a general consensus that the amount of working capital available to an organization can be maximized through effective management of four key areas: cash, inventory, receivables, and payables. The central principal guiding working capital maximization for each of these areas is to “use someone else's money every chance you get and don't let anyone else use yours.” The key considerations for each of those four areas are briefly considered here.

One perspective emphasizes the importance of cash flow and has produced a number of sophisticated models and decision heuristics for cash management. Those models assign present values to resource allocation decisions which take into account the effect of individual decisions on cash flows and cash volume across the organization. Sagan^[5] highlights this fact in one of the first discussions of working capital management by claiming “From an operational point of view, the money manager's primary concern is with the current cash flows and those flows expected in the near future. He can take little comfort in a satisfactory working capital ratio when he does not have funds to meet an immediately due payment.” This is especially true in public organizations, where cash flows from tax collections, donations, government grants, intergovernmental revenue sharing, and other typical revenue sources occur infrequently.

Another potential source of working capital is tighter management of receivables and payables. Corporate organizations can significantly increase their available working capital by forcing customers, distributors, and other payees to pay as quickly as possible while simultaneously delaying payment of their own

invoices for as long as possible. But public organizations typically cannot pressure taxpayers, donors, grantors, and other revenue providers into early payment without notable consequences. Instead, many public organizations have turned to lockboxes, prepayment envelopes, discounts for early payment, and other practices that promote rather than coerce quick collection of receivables. Public organizations also have less latitude than their corporate counterparts in their relationships with vendors. Given the sheer scope of services that public agencies provide, coupled with a general lack of available providers, public agencies are often not able to renegotiate contracts or threaten to take their business elsewhere when vendors are not willing to meet inventory management schedules. These and other considerations suggest effective management of receivables and payables can free up some, but perhaps only limited, working capital.

Inventory management is also a critical working capital consideration. Inventories are a sizable investment for any organization, but are a significant drag on productivity because they earn no interest. Current corporate practices, particularly those implemented by Dell Computer Corp. and other “New Economy” firms, suggest aggressive inventory reduction strategies can generate tremendous cost savings while freeing up sizable working capital reserves. Although many of these strategies are not available to public sector organizations (as previously mentioned), the general principle that minimizing standing inventory while maximizing the frequency of inventory turnover can affect the amount of available working capital.

SUGGESTIONS FOR FUTURE RESEARCH

Public sector working capital management is clearly in its early stages. To that end, future research should consider three recent trends that are likely to affect its future development.

First and foremost, researchers should consider the state of the practice of working capital in public organizations. Studies by Wolkoff,^[6] Shelton, Tyer, and Hembree,^[5] and Marlowe^[7] suggest that many municipal governments keep large working capital reserves but lack policies and procedures governing the use of those reserves. Marlowe’s study, for example, estimates that the total general fund balance for U.S. cities and villages alone may exceed \$46 billion. A rough estimate suggests that this sum is equal to 25–50% of the municipal debt outstanding to those same governments. Future research should examine how public organizations create and maintain working capital, and whether those practices coincide with recommended practice.

A second area of inquiry surrounds recently proposed changes in financial accounting and reporting

of working capital. There is some ambiguity under the current Governmental Accounting Standards Board (GASB) model regarding the use and effects of fund balance and net assets. That model clearly states reserved fund balance, for example, ought to be legally restricted for some particular purpose where unreserved undesignated fund balance is available for appropriation. But entities are given much more latitude surrounding their use of designated fund balance. The GASB is currently considering a number of new accounting standards that will likely alter the potential uses for this key pool of working capital funds. Future research should consider the role of designated fund balance in working capital management, and how that role may be altered by changes to GASB standards.

And finally, researchers may also consider recent developments in the process of working capital management. The practice of working capital management clearly entails a wide and often contradictory set of objectives, practices, and skills. This tension was described by Sagan,^[5] who, in one of the earliest examinations of corporate working capital practice, claimed “The money manager should be a combination of a credit analyst, a commodity specialist, a money market expert, a bit of a horse trader, and a banker. As such he possesses a proper balance of art, science, and diplomacy. If he possesses these, together with an ability to read the future, his will be a successful career.” Sagan’s comments certainly place a premium on the “art” of working capital management, which is clearly that of simultaneously pursuing multiple goals under a variety of constraints.

While there is certainly no substitute for a seasoned working capital manager, recent developments in linear programming, goal optimization, and other areas of applied mathematics provide powerful tools to aid working capital decision-making. While these tools and techniques proceed from different assumptions and applications, they all provide decision makers with information about how to optimize available resources in the face of multiple goals and constraints. Linear programming approaches, such as those presented by Sartoris and Hill,^[8] Merville and Tavis,^[10] and Bierman, Chopra, and Thomas,^[9] have become increasingly popular as a means for optimizing working capital productivity and cash flow in the short term. Aman Khan^[11] provides multiple examples and potential applications of optimization models for government operations. These models are especially useful in the governmental context given the multiplicity of political actors and fragmented objectives that act upon public financial decisions. These models could certainly be applied in the working capital context, and could result in a better understanding of how to maximize working capital productivity while pursuing the previously mentioned strategic goals. Future

research should expand and develop applications of these sorts of models for working capital decisions.

CONCLUSIONS

This chapter has examined working capital, or the difference between current assets and liabilities, from both a technical and a managerial perspective. It suggests that working capital management in the public sector is a complex process, affected by a variety of often contradictory goals and objectives. It also discussed how that complexity is reflected in current public sector accounting and reporting standards, a lack of broadly accepted working capital policies and practices, and recent attempts to manage that complexity through linear programming and other mathematical models. As public sector organizations face increasing fiscal pressures, effective working capital theory, management, and technology are likely to add much value to public management.

Yield Curve for Public-Sector Debt Instruments

Theo Edwin Maloy

*Department of History and Political Science, West Texas A&M University,
Canyon, Texas, U.S.A.*

INTRODUCTION

Debt is created when a government, firm, or individual borrows money from another government, firm, or individual. The borrower gains immediate buying power in exchange for a promise of repayment, while the lender delays buying power in exchange for periodic or lump sum of interest payments in addition to the promised principal repayment. Depending on negotiated terms, the borrower repays the principal to the lender in scheduled periodic payments or in a lump sum on the due date, called the maturity.

Governments and firms primarily borrow money when annual expenditures exceed revenues, to spread the cost of long-term capital programs uniformly over the duration of the program, or when immediately due obligations exceed the short-term cash in the treasury. Individuals primarily borrow money for large expenditures that exceed cash in current liquid accounts, and when short-term cash flow does not meet current expenditures.

Governments, firms, and individuals borrow money for varying lengths of time. Lenders face varying degrees of repayment risk based on the financial conditions of the borrowers, of the financial markets, and of the debt instruments' specific terms. Given that different borrowers and debt instruments have different risks and maturities, different debt agreements can only be reached with different interest rates. At any given time, those interest rates can be charted for a particular borrower, such as the federal government or a low-risk or high-risk corporate borrower, and for different maturities, from one month to thirty years. The chart, with interest rates on one axis and maturities on the other, is called the "yield curve" because interest payments are called "yields" by investors.

MECHANICS OF BOND VALUES

The majority of government borrowing is through the sale of bonds. A bond is a contract to repay the borrowed principal upon a specific date, the maturity, in addition to making interest payments.^[1] Historically, bonds were paper certificates with coupons attached that were redeemed for interest payments. Today,

almost all bonds are issued in non-physical "book entry" form, with the issuing financial entity keeping records of all bonds and bondholders in their computer databases. Instead of receiving cash in exchange for coupons, bondholders receive their interest by direct deposit.

Federal government bonds are issued in multiples of \$1000 for maturities of up to 20 years. Governments, including the federal government, use different, but similar instruments to borrow for periods of less than one year. Some financial instruments are issued in up to \$10,000 units of face value.

Interest, the periodic fee for the use of borrowed money, is usually stated as a percentage of the face value of a bond. This yearly percentage "coupon rate" is usually divided into semiannual payments.

Although the federal government no longer issues bonds with maturities longer than 20 years, other governments and private firms issue bonds with maturities of 30 years or longer. Because of the long maturities, many bond buyers ("lenders") find it necessary to sell the bond before maturity. While bonds are initially issued in the "primary" market, there is an active "secondary" market where previously issued bonds are bought and sold by institutions and individuals.

If interest rates have risen in financial markets, the seller may receive less than the face value for the bond. If interest rates have fallen, the seller may receive more than the face value for the bond.

The market price of a bond is the present value of all cash flows at an appropriate discount rate.

A bond's present value is calculated using an elementary formula where the future value (the future cash flow) is divided by one plus the interest rate raised to the power of the number of years until maturity:

$$PV = \frac{FV}{(1 + r)^n}$$

This simplest case is called a "Zero Coupon Bond" because it has no coupon rate. The lender and the borrower agree to some principal amount and some interest rate. The lender then gives the borrower the present value of the face value when discounted at some interest rate for some number of years.

If the borrower promises to pay the lender \$1000 in twenty years with an interest rate of 5%, this is the calculation:

$$PV = \frac{\$1000}{(1.05)^{20}}$$

The divisor is 1.05 to the 20th power, or 2.653298. When \$1000 is divided by 2.653298, the present value is \$376.89.

The calculation is only slightly more complicated for a bond with yearly interest payments:

$$P = \sum_{i=1}^m \frac{FC}{(1+r)^i} + \frac{F}{(1+r)^m}$$

where P is the market value, the current cash price of a bond, M is the number of years until maturity, F is the face value of the bond, C is the coupon rate, and r is the current market interest rate on bonds of the same maturity and similar risk.

If interest is paid semiannually, then “ m ” would be doubled and “ r ” would be divided by 2. The periodic payment would also be divided by 2, because half the yearly interest is paid twice as often:

$$P = \sum_{i=1}^{2m} \frac{FC/2}{(1+r/2)^i} + \frac{F}{(1+r/2)^{2m}}$$

If a twenty-year 7% coupon-rate bond with a \$1000 face value had one year to maturity, this is the present value calculation if the current marketplace was requiring a 6% return for \$1000 one-year maturity bonds with the same risk:

$$1009.43 = \frac{70}{1.06} + \frac{1000}{1.06}$$

A buyer in the open market will pay \$1009.43 for a bond that appears to be “worth” \$1000. The reason that the price is more than \$1000 is because the \$70 coupon payment is more than the \$60 interest payment that a buyer could get on a new one-year \$1000 bond.

In the marketplace, the value of the bond is constantly adjusted to a price based on the current appropriate interest rate. If some event caused the appropriate interest discount rate to rise to 9%, the one-year bond would be valued at \$981.65:

$$981.65 = \frac{70}{1.09} + \frac{1000}{1.09}$$

If an existing bond’s market value, face value, coupon rate, and maturity are known, a similar equation

can be solved for the current market-required interest rate, which would be the discount rate.

Required Interest Rate

Lenders use several factors to determine any debt instrument’s appropriate required interest rate, which becomes the discount rate. The first component of any interest rate is the “risk-free rate of interest.” This is the interest rate a lender would require if there were absolutely no chance of default by the borrower. Historically, this rate has approximated to 2–3%. Short-term federal debt can be used to estimate the risk-free rate, and in early 2005 the interest rate on a one-month federal instrument fluctuated around 1.9–2.1%.

To calculate the interest that any particular borrower would have to pay, a “default-risk premium” is added to the risk-free rate. This is the premium for the possibility that the lender would not get all of the interest payments and the principal. It is also an insurance payment against the possibility that the interest payments and the principal will be paid but that they will be paid after the scheduled payment date. Many banks charge their “most credit-worthy” customers what they call their “prime rate.” A large corporation might pay an interest rate 1% above the risk-free rate. The loan would be about as safe as lending to the federal government, but not as safe. A state government might pay an interest rate 3% above the federal government; a local government might pay an interest rate 6% above the federal government. A state or local government might pay a lower interest rate if they pledge some specific cash flows, like highway toll payments, to repay the debt. If they pledged only their “full faith and credit,” a lender probably would require a higher interest rate. The default premium is specific to each lender and the lender’s collateral. To help lenders determine the probability of default, several financial institutions rate the danger of buying state, local, and special district debts. Lenders can also buy default insurance, and some borrowers buy the insurance for the lenders under the terms of their financial negotiations. Investors buying debt instruments in the secondary market also will base their discount rate on the debt’s risk and risk rating.

Lenders also require an “inflation premium” to make the purchasing power of interest and principal payments equal that of the original debt’s purchasing power. At the beginning of the millennium, inflation rates were quite low, but many investors remember 14% inflation rates in their lifetimes. The inflation premium will fluctuate with investors’ inflation expectations. In early 2005, the inflation premium on a 20-year federal bond appeared to be less than 3%.

Lenders may lend their money for any number of years, but they may not want to loan their money for the full term of a 20-year bond. Therefore, borrowers pay a “liquidity premium” to the interest rate to compensate for the possibility that their debt investment may not find an active market. A federal bond will have a ready market. Most state bonds will have a semiactive market. However, to sell an illiquid special district bond, an investor might have to accept a lower price than the bond’s risk would predict.

(Life insurance companies and other financial institutions buy bonds of all maturities, because they will need constant liquidity to pay death benefits. One way that a company might increase its cash flow would be to buy bonds that have large liquidity premiums. The bond will be held to maturity, so there will be no revenue loss because it is hard to find a buyer. The liquidity premium will be earned until maturity. However, a state or municipality cannot avoid paying a higher interest rate for an illiquid bond. If there is no liquidity premium, investors will buy other bonds. The liquidity premium will increase.)

Borrowers must also pay a “maturity-risk” or market premium. The maturity-risk premium relates the value of the debt instrument to the probability that the overall financial market will fluctuate. When a lender invests in a long-term debt asset, certain default and inflation assumptions exist in the market. However, those assumptions may change many times before the bond’s maturity. Because investor-specific conditions might cause a lender to sell debt investments during a time when interest rates have risen and the value of a specific bond has fallen, lenders will require a maturity-risk premium to compensate for potentially having to sell a bond when its price is low. The longer the term of a bond’s maturity, the higher the maturity-risk premium (Table 1).

The formula for the interest required from any particular debt instrument is

$$k_i = k^* + DP_i + IP_i + LP_i + MP_i$$

where “i” is the indication of each particular debt instrument.

The interest rate compensates the lender for delayed income and consumption. That is why the interest rate used for discounting in benefit–cost analysis is called

the “social rate of time preference.” The interest rate indicates how much an investor requires in interest for delayed consumption and for allowing government borrowers to consume today.

Because different lenders and borrowers have different social rates of time preference, different rates of risk tolerance, and different demands for current consumption, there is a large supply of long-term, intermediate-term, and long-term debt instruments of all degrees of risk. To determine the marketplace’s interest rate, inflation, and business condition expectations, current interest rates on bonds of all maturities can be charted into a yield curve. The United States Treasury Department publishes data to plot daily and historical yield curves.^[2]

Theoretically, a three-year interest rate is calculated by multiplying one plus the first year’s interest rate time one plus the second year’s interest rate, times one plus the third year’s interest rate, and taking the geometric cube root of the product (and then subtracting 1). Multiplying the 20 required interest rates plus 1 and then taking the geometric root (and subtracting one) would determine a 20-year maturity’s interest rate. However, as a future required interest rate is unknown, the yield curve is established by investors’ economic predictions. Conversely, the yield curve helps predict the economic future.

Yield Curve^[3]

Typically, market watchers and investors talk about interest rates going up or down as if all rates moved together. However, short-term and long-term bonds’ market prices often move independently in the marketplace, because economic conditions make some maturities less or more attractive to investors. The yield curve charts display various patterns, which can be interpreted as economic predictions and projections.

(During difficult economic times, investors might prefer high-quality, safe, but low yielding debt. During prosperous economic times, investors might prefer lower-quality bonds because they believe that the market is overestimating the debt’s default risk. Under some conditions, there might be separate yield curves for higher- and lower-quality debt.)

Ordinarily, short-term bonds of whatever risk will have lower yields that reflect long maturities’ additional risk. A “Normal Yield Curve” will slope upward to the right as maturities and yields increase. For federal government 20-year debt, the longer (right) end of the yield curve normally will be 2–3% higher than the shorter (left) end of the yield curve (Fig. 1).

When bond buyers expect the maintenance of economy at its normal pace without significant changes in inflation, the normal yield curve persists. However,

Table 1 Interest rate components

Real risk-free interest rate	k^*	2–3%
Default-risk premium	DP_i	1% or more
Inflation premium	IP_i	3% or more
Liquidity premium	LP_i	0% or more
Maturity-risk premium	MP_i	0% or more

Fig. 1 Normal yield curve.

when bond investors believe that the economy will improve in the future, the yield curve will dramatically increase in slope (Fig. 2).

This shape is typical at the beginning of an economic expansion or at the end of an economic recession. Short-term interest rates are lowered by the economic recession, but long-term interest rates will rise as borrowers gather money for investment during the anticipated economic revival. Long-term lenders will demand a larger inflation premium, because economic expansions are often accompanied by increased inflation. During most economic expansions, with investor anticipation, the slope of the yield curve will increase even before the economy revives. While this is not a guarantee of economic improvement, a steepening yield curve is often accompanied by predictions of coming prosperity (Fig. 3).

Conversely, when investors believe that the economy is entering a recession, and that demand for borrowed money will decline, lowering interest rates, an inverted yield curve will be formed. Investors will anticipate that borrowers will soon reduce the supply of long-maturity debt. The investors will increase the supply of long-maturity money, lowering the price of long-maturity debt as debt sellers (borrowers) find

Fig. 2 Steep yield curve.

Fig. 3 Inverted yield curve.

more debt buyers (lenders) in the marketplace. Truly inverted yield curves are rare, always accompanied by predictions of an economic slowdown, and usually followed by an economic slump. Inverted yield curves are also harbinger of lower yields all along the yield curve (Figs. 4 and 5).

To become inverted, the yield curve must pass through a stage in which it is either flat or humped. Often flat or humped yield curves are interpreted as being inverted yield curves. Even flat or humped yield curves are indications of coming economic slowdowns, if not of economic slumps. For financial institutions, like banks, inverted, flat, or humped yield curves lead to lower interest income on loans.

Moving the Yield Curve

While the Federal Reserve controls only the short end of the yield curve, it is often given the credit (or the blame) for moving the curve or changing its shape. The Federal Reserve influences the short of the curve in an effort to achieve its policy goal of low and stable inflation and maximum sustainable output. A monetary policy tightening generates high nominal interest rates, but, because of its anti-inflationary effects, these rates quickly fall back. As long-term rates embed expectations of this behavior of short-term rates, they rise by only a small amount. As a result, the slope of

Fig. 4 Flat yield curve.

Fig. 5 Humped yield curve.

the yield curve declines when contradictory monetary policy shocks occur.^[4]

CONCLUSIONS

The sources of debt securities' supply and demand are well understood. It can be explained using elementary

mathematics as to how the marketplace prices bonds once a discount is determined. Empirical research reveals as to how lenders formulate their interest-yield discount-rate demands. The yield curve illustrates and explains this marketplace, but the yield curve is dynamic. It moves because of changing human behavior, but not mechanically. While the yield curve becomes a basis of economic prediction, the yield curve is not a determinant of the economic future. Macroeconomists face an interesting future as they attempt to explain the yield curve and its role in the macroeconomy.

Zero-Base Budgeting

J. L. Peters

*Department of Public Management, John Jay College of Criminal Justice,
City University of New York, New York, New York, U.S.A.*

INTRODUCTION

Zero-base budgeting (ZBB) rejects a previous year's budget as the basis for future resource allocation decisions. Like other performance budget approaches, ZBB seeks to maximize efficiency and eliminate waste and redundancy. But unlike other approaches, ZBB shifts attention away from a reliance on precedents established in previous budgets and focuses instead on the achievement of planned objectives. This shift is intended to emphasize the role of analysis as the basis for allocation decisions rather than subjective factors that might impede or obfuscate the process of arriving at an optimal resource distribution. Because ZBB abandons the premise that budgets are inherently incremental—that each new budget should be based upon the previous year's appropriation—it requires that every aspect of the budget be justified anew each year. As such, it has been considered by some as the most radical and controversial of all modern budget reforms.

THE ORIGINS OF ZBB

In 1940, Key Jr. asked, “On what basis should it be decided to allocate x dollars to activity A instead of activity B?”^[1] That question was his basis for arguing that analysis should play a key role in budgetary decision-making. Key asserted that while the budget reflects a set of value judgments as to how scarce resources should be allocated, traditional methods of budgeting offered no way to determine the social utility of those allocations, nor any means of evaluating the efficiency in achieving desired ends. Moreover, he argued, “If it is assumed that an agency is operating at maximum efficiency, the question remains whether the function is worth carrying out at all, or whether it should be carried out on a reduced or enlarged scale, with resulting transfers of funds to or from other activities of greater or less social utility.” (While Key did not specifically propose what eventually became known as performance budgeting, his article could definitely be seen as the catalyst for ensuing developments in that area.)

Lewis^[2] provided the fundamental premise for ZBB when he asserted that “to be justified in terms of making the most advantageous use of resources, the return from an expenditure for any activity must be more desirable and more necessary than for any alternative use of funds.” ZBB specifically requires a manager to justify an entire budget rather than just the increment being requested. In doing so, the manager is forced to redefine the “budget base to include decrements and not just increases in funding.”^[3]

ZBB first appeared in the federal government in 1962, but Burrows and Syme trace its origins all the way back to 1892, when Bastable argued against reliance on past budgets as the sole basis for future allocation decisions.^[4] The first US reference to ZBB-related concepts appeared in 1917, when Willoughby et al. published their comparative study of budgeting in Britain, France, and Germany.^[4] Early 20th century budget reformers on both sides of the Atlantic—including Higgs, Keynes, Durell, and Lewis—promoted a number of principles that were precursors to modern ZBB. Burrows and Syme credit Pyrrh with “claiming an apparently successful implementation” of what he referred to as “zero-base budgeting.” The term, however, was used by Wildavsky and Hammond several years earlier.^[5]

ZBB gained little attention until Pyrrh published his research on the use of ZBB in the private sector in the 1970s.^[6] Although the US Department of Agriculture had quickly abandoned its experiment with ZBB, it quickly gained favor with politicians such as the then Georgia Governor Jimmy Carter who saw in ZBB an opportunity to force agencies to be accountable for every dollar appropriated to them.^[7] ZBB integrated essential functions such as comprehensive planning, resource allocation, program management, and evaluation into a system designed to bring greater rationality to the budget process.

ZBB

ZBB is designed to promote both efficiency and effectiveness, enhance both long- and short-term planning, eliminate redundancy and waste, and promote greater

accountability in organizations. It encourages greater participation and coordination among all levels of management in the planning, evaluation, and budget processes by initiating the decision-making process at the bottom tiers of the organization and aggregating them as they rise through the hierarchy. Zero-base budgeting makes no distinction between existing and new programs. The basis for budgetary decisions is a comparison that weighs the relative effectiveness of one alternative against another. Both new and existing programs are subjected to the same level of scrutiny and evaluation. Managers use the results of their evaluation to establish priorities among the existing and alternative programs and, as necessary, reallocate resources from lower to higher priority activities.^[8] Managers also periodically reevaluate policy objectives. On such occasions, new objectives may be set or existing ones may either be maintained or adapted to reflect current need. Ongoing evaluation of existing programs assures that planned objectives are being met.

The techniques used in the budget-making process are standardized so that all budget submissions are consistent in content and formulation. These objectives can be achieved by requiring managers to consider a range of alternative strategies and trade-offs as well as consider the potential consequences of implementing each one as they attempt to arrive at the appropriate allocation decision.^[6] ZBB, therefore, theoretically facilitates zero-sum reallocation. An increase in expenditures in one program area can be offset by reductions in spending elsewhere in the budget. In practice, however, forcing managers to make such trade-offs can be difficult. Sunk costs, longstanding commitments to clients, and strong public or political support are potential impediments to such trade-offs.

STEPS IN THE ZBB PROCESS

Sarant identified four basic steps in the ZBB process: identification of decision units, development of decision packages, review and ranking of decision packages, and preparation of the budget.^[9] (Sarant identified four basic steps in the zero base budgeting process—the model used here. Cozetto, Kweit and Kweit identified five steps, while others, including Pyhrr, defined as few as two). But before an organization can undertake the ZBB process, it must conduct a thorough analysis to determine its suitability for the system. Once that determination has been made, the organizational structure and managerial hierarchy should be reviewed to identify the organization's "decision units." A decision unit is a discrete program or service area within an organization under the supervision of a manager. A decision unit should encompass

all aspects of the activity, yet be the smallest unit for which basic allocation decisions must be made. The budget provides a good starting point for identifying decision units. Large decision units may be subdivided into several smaller ones so that a meaningful review of budget, objectives, and performance may be undertaken. Decision units should be carefully accounted for to assure that no duplication occurs.

The decision units become the focus of planning activities to set long-term goals and objectives, establish programs, and create policies. In the public sector, these steps may initially be the responsibility of the legislature rather than the organization. However, under ZBB, it is essential that the organization defines its own missions, goals, and objectives, as well as measures against which the program's performance will be compared.^[10] The performance measurement system should consider both the effectiveness of program activities and the efficiency with which that activity is meeting its objectives.

ZBB is known as a decentralizing budget analysis technique because it essentially works from the bottom up, although the process begins at the top. Upper management establishes goals and objectives for lower management to address, such as service levels, expected output, and funding targets. The remaining steps are undertaken by lower management, which carefully reviews its programs and proposes a range of alternatives (the number will vary) for achieving operational objectives.^[11] At every level of the organization, managers use their expert knowledge and judgment to select the preferred alternative on the basis of relative value, and by that selection, determine the resources necessary to implement them.^[12] The manager submits this information to upper management in the form of "decision packages."

A decision package is a brief report that specifies goals and objectives and provides relevant information that facilitates decision-making as the process moves forward, including information on program costs and benefits, performance measures, and alternative proposals for achieving them. The alternatives represent different levels of funding activity or performance, generally at the minimum level, current level, incremental level, and decremental level.^[13] During this phase of the process, careful consideration will also be given to the potential consequences of not providing the service at all. This information gives upper management a full range of funding options to use in their deliberations.

The third step in the ZBB process is the ranking of decision packages based on organizational goals and objectives. Decision packages are ranked in descending order according to priority, enabling managers to consider each alternative in the context of the others as well as the consequences of each option. In a large

organization with a multitiered hierarchy, the preparation and ranking of decision packages will occur several times. As decision packages ascend through the hierarchy they are consolidated into logical groupings. It is essential during this step to make decisions at the appropriate management level. Certain decisions are better made in the upper tiers of management, while others may be made at lower levels of the organization.

The fourth and final step in the ZBB process is the preparation of the budget. Done properly, the previous three steps provide the organization with not only a detailed and accurate assessment of resources needs but also the means with which to fund programs at levels appropriate in relation to competing priorities. Budget preparation proceeds according to guidelines set forth by the executive and the central budget office. Zero-base budgeting provides program managers with an essential tool for defending their budget requests.

Once a budget is approved and implemented, ZBB relies on evaluation and monitoring procedures similar to those employed in any other type of budget. Program performance, in particular, is closely monitored to assure that objectives are being achieved. Feedback is acquired through various means to assess problems or opportunities that arise during the fiscal year. All of these data are critical inputs in the ZBB system.

SHORTCOMINGS OF ZBB

Many of the shortcomings discussed in this section are not necessarily unique to ZBB, but they are particularly problematic for a results-oriented budget. An effective budget—one that successfully links an organization's output with what it intends to accomplish—relies upon timely, consistent, and reliable information and that is a fundamental challenge for ZBB. Schick^[14] argued that “the true test of performance measurement is in its use as the means by which organizations are managed and resources are spent.” Too often, however, performance measures fall far short of the mark for a variety of reasons. One problem is the unavailability of relevant measures at critical points in the budget cycle. Performance measures are generally collected at the end of a program year, while the budget calendar might demand that information at a much earlier date.

Forsythe^[15] outlined a number of others problems such as a lack of consistency between the information used in budget accounts and the information available to organizational units. Data on crosscutting programs—programs that cut across a number of agencies—is especially difficult to produce. Some budget systems require cost accounting, an expensive and difficult undertaking. Another obstacle to the

development of good performance measures may be the existence of divergent agendas among the legislature, agency officials, and other stakeholders participating in the development of performance measures. This can result in the collection of data not suitable for budgetary decision-making.

Even when relevant information is available, it cannot tell the whole story. Budgeting inevitably involves projections into the future and it is impossible to make accurate estimates of future needs or resources.

Conflicting objectives are also an impediment to an effective budget. Fossett, Gais, and Thompson^[16] coined the term “dissonant spillover” to describe the phenomenon of having agencies working in the same general policy sphere pursue conflicting objectives.

Legislation at the state and federal levels, which mandates minimum levels of service for certain programs presents another impediment to successful implementation of ZBB. Such requirements compel a government to maintain spending levels regardless of a preference for more efficient and effective programs.

Management and measurement of performance data are critical aspects of ZBB, which was first introduced during an era before desktop computers became standard office equipment. At that time, only the largest organizations had the capacity to do the detailed analysis necessary to develop meaningful measures. Although managers eventually overcame this problem, ZBB continues to have one major shortcoming: many managers find it simply too complicated and overwhelming, even with currently available technology. Zero-base budgeting requires a huge amount of data to be properly implemented, and managers and politicians alike often balk at the challenge of dealing with the volume of work. In addition, the entire process requires a sizable commitment of time.

In 2001, Metzgar and Miranda^[17] reviewed the new technology available to budgeteers in an effort to determine whether or not it would have an impact on budget reform. They cautiously concluded that while advances in technology can facilitate the adoption of budget reforms such as ZBB, “the behavior of budget actors and the structure of budget processes matter.” In his study of ZBB, Wholey^[18] found that lacking the means and commitment to make ZBB work, managers fell back into their old habits of devoting valuable resources to programs that were not a high priority, focusing more attention on the size of appropriations than on the efficacy of the programs being funded. In addition, some found that, for all their effort, they got a relatively minimal return. Savings in tax dollars and improvements to government programs were not enough to justify the high implementation costs of the ZBB system. In some cases, the alternatives ultimately adopted by the agencies using ZBB only reflected incremental changes from

the previous budget.^[19] Williamson concurred, citing that at least one experiment with ZBB found that it served a “negligible role” in shifting financial resources.^[20]

TODAY'S ZBB

Although ZBB was politically unpopular when President Jimmy Carter tried to bring it to Washington in the 1970s, it continues to have its proponents. It has been the foundation of Georgia's budget process as Carter was the state's governor.^[21] Colorado, Nebraska, Idaho, Iowa, and Oregon also use ZBB to some extent. Each uses a modified form of the system, pairing it with program budgeting or other forms of performance budgeting. Other states such as North Dakota have implemented the system on a trial basis, eventually opting not to use it but to adopt some of its elements.^[22] The system, however, remains largely unpopular with many practitioners who denounce it as a waste of time and effort. Perhaps the most interesting evidence of ambivalence about ZBB can be seen in Nebraska where the executive branch has embraced a results-oriented, performance-based approach while the legislature persists in utilizing the incremental approach.^[23]

The National Conference of State Legislatures (NCSL) as well as other professional organizations such as the National Association of State Budget Officers and the Government Finance Officers Association recommends the use of a modified form of ZBB. They base their recommendation on the fact that an annual review of existing and proposed programs is simply not feasible. All of the states that currently use ZBB, according to NCSL, employ a modified version of the system. Many opt instead to use target-based budgeting—a modified form of ZBB that does not require a full justification from base zero every year.^[21]

Interestingly, the 1994 Republican Contract with America^[24] proposed that ZBB be implemented at the federal level. Realistically, however, full review of some programs on an annual basis may be inappropriate, particularly when legislation mandates minimum service levels.

CONCLUSIONS

Zero-base budgeting is based on the nearly irresistible premise that it would help government to make optimal resource allocation decisions. It has ultimately failed to fulfill its promise because, in its purest form, ZBB runs counterintuitive to the behavior of practitioners involved in the budget process. Wildavsky and Hammond echoed the sentiments of many critics

of ZBB when they concluded “comprehensive ZBB vastly overestimates man's ability to calculate and grossly underestimates the importance of political and technological constraints.”^[5] Key's challenge has yet to be met.
